IMPACT OF COVID-19 PANDEMIC ON HOSPITALISATION TRENDS AND OUTCOME OF CARDIOVASCULAR DISORDERS; AN OBSERVATIONAL STUDY

A THESIS SUBMITTED TO

BABA FARID UNIVERSITY OF HEALTH SCIENCES, FARIDKOT (PUNJAB)

IN THE PARTIAL FULFILLMENT

FOR THE AWARD OF DEGREE OF

DOCTORATE OF MEDICINE

IN

CARDIOLOGY

MAY 2023

Submitted By

DR SUSHIL KUMAR

DEPARTMENT OF CARDIOLOGY
DAYANAND MEDICAL COLLEGE AND HOSPITAL
LUDHIANA, PUNJAB

DECLARATION BY THE CANDIDATE

I hereby declare that the thesis entitled "**IMPACT OF COVID-19 PANDEMIC ON HOSPITALISATION TRENDS AND OUTCOME OF CARDIOVASCULAR DISORDERS; AN OBSERVATIONAL STUDY**" submitted towards partial fulfillment of the requirements for the award of **DM** in **Cardiology** degree to BFUHS is a compilation of original work carried out by me under the supervision of **Dr. Gurpreet Singh Wander**, Professor & Head, Department of Cardiology and **Dr. Bishav Mohan**, Professor, Department of Cardiology. No part of this thesis has formed the basis for the award of any degree previously.

ACKNOWLEDGEMENT

Newton once said “if I have seen farther than others, it is by standing upon the shoulders of the giants”. If I have been able to complete this thesis, it’s only because there was a good team involved. I am highly grateful to the Almighty, who is omnipresent and ever compassionate, guiding us through the life in his own ways. Without his blessings nothing can be achieved or accomplished.

I take this opportunity to thank all those who have been helping me in the successful completion of this work.

With a deep sense of gratitude, I wish to convey my thanks to my esteemed teacher and supervisor **Dr. GS Wander,** Professor & Head, Department of Cardiology, DMCH, Ludhiana who is a towering figure and continues to inspire us to excel in our endeavors. His truly scientist intuition has made him a constant oasis of ideas and passions in science, which exceptionally inspired and enriched my growth as a student, a researcher, and a scientist. He has supported me throughout my thesis with his patience and knowledge whilst allowing me the room to work in my own way. One simply could not wish for a better or friendlier supervisor. His able and mature guidance made the assigned task easier to accomplish. His indelible help and co-operation helped me a lot in the compilation of this project.

I am deeply indebted and thankful to my co supervisor **Dr. Bishav Mohan,** Professor, Department of Cardiology, DMCH. I take great pride in expressing my gratitude to him. He has always been an epitome of excellence for me and someone who has always been there for me. It has always been an honor to work under his awe-inspiring guidance. His never ending support and encouragement has always been the source of inspiration. He has always encouraged me to strive for perfection and stretch my limits with his exemplary leadership.

It is with great reverence that I acknowledge the valuable suggestions, scholarly guidance and constant encouragement rendered by **Dr. Bhupinder Singh**, Additional Professor, Department of Cardiology,

AIIMS, Bathinda. An opportunity to learn from him has been one of the special things that this work provided.

I am sincerely thankful to the nursing staff under supervision of **Mrs. Manjit Bawa** of Hero DMC Heart Institute, for their never ending help and support at various stages during the study.

I would take this opportunity to specially thank **Mr. Raja Gupta, Mr Gurinder Mangat, Mr. Tarun Sharma, Mr. Jagjeet Bajwa, Mr. Gurpreet Singh** and other staff of the Research and Development department, DMC&H whose effort and support have been never ending. This robust task was not possible without their constant effort and enthusiasm. They have worked tirelessly for the project and helped in the compilation of the data and organizing it and later compilation of study and printing it. This study would have been incomplete without the valuable inputs of **Mrs. Namita Bansal**, who was kind enough to always help me with her expertise in statistics, without her help this project would not be completed in time.

Last but not the least; I would like to thank my family members who have helped me with this project. My family members have been a constant source of support – emotional, moral and financial during my postgraduate years, and this thesis would have certainly not existed without them. Words would never be able to do justice in expressing my gratitude towards my family for being my pillar of support in my journey. I am deeply indebted to my **father Sh. Parmanand Saini**, my **mother Smt. Maya,** my in laws **Sh. Jaswant Singh** and **Smt. Paramjeet, my wife Dr Shilpa Saini, my sister Ms. Aarti Saini, my brother Dr Jitender Saini & my sister-in-law Dr Saumya Srivastava** and **my brother-in-law Mr. Shivam Saini & sister-in-law Mrs. Anjali Saini** for being ever so understanding and bearing with me patiently through everything, without their support and cooperation this task was impossible.

Dr. Sushil Kumar

ABSTRACT

Introduction: The COVID-19 pandemic has not only caused direct effects on population but also had indirect effects on morbidity and mortality through changes in patient's and clinician's behaviour and health system reorganization. The interaction between COVID-19 and the cardiovascular system has been of particular concern, as patients with pre-existing CVDs are at an increased risk of developing severe form of the disease. Understanding the cardiovascular damage caused by SARS-CoV-2 is crucial for effective treatment and reducing mortality rates. Healthcare system restructuring during the pandemic may also have collateral effects on patients with established CVD. Further research and follow-up studies are needed to fully understand the long-term effects of COVID-19 and develop appropriate management strategies.

Aim of Study: To determine the effect of COVID-19 pandemic on hospitalisation trends and outcome in cardiovascular disorders.

Materials & Methods: A retrospective and prospective hospital-based analysis was conducted on patients admitted for cardiovascular disease during pre covid and covid timeline. Baseline characteristics, past & presenting illnesses, treatment strategies and outcomes were compared between the two groups. Data was analyzed using appropriate descriptive statistics and statistical tests, including the Kolmogorov-Smirnov test, Mann Whitney U test, Chi-square test, and Fisher exact test. A p-value less than 0.05 was considered statistically significant, and SPSS 21 version was used for statistical calculations.

Results: COVID-19 can exacerbate existing cardiovascular conditions, leading to increased hospitalizations, complications, and even mortality. Additionally, there have been reports of new-onset cardiovascular complications associated with COVID-19, such as myocardial infarction, atrial fibrillation and thromboembolic episodes. The impact of COVID-19 on hospitalizations and outcomes for various cardiovascular diseases has underscored the urgent need for public health measures, comprehensive screening approaches, and psychological support. , the pandemic has shed light on the persistent inequalities in healthcare access and outcomes, including those related to age, sex and geographic location.

Conclusions: The impact of COVID-19 on hospitalizations and outcomes for various cardiovascular diseases emphasizes the need for a multi-faceted approach that encompasses public health measures, effective vaccination strategies, targeted screening, and addressing health inequalities. These efforts are essential for minimizing the adverse effects of COVID-19 on cardiovascular health and ensuring better outcomes for individuals with cardiovascular diseases.

Keywords: Covid 19, Cardiovascular Diseases, Myocardial Infarction, Atrial Fibrillation.

INTRODUCTION

In December 2019, an outbreak of pneumonia caused by a novel coronavirus occurred in Wuhan, Hubei province, and has spread rapidly throughout China, with an ongoing risk of a pandemic. [1] After virus identification and isolation, the pathogen for this pneumonia was originally called 2019 novel coronavirus (2019-nCoV) [2] but has subsequently been officially named severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) by the WHO. On 30 January 2020, the WHO declared the outbreak of SARS-CoV-2 a Public Health Emergency of International Concern. [3]

Beyond direct effects of the coronavirus disease-19 (COVID-19) on populations in every country, the pandemic had and was continued to have indirect effects on morbidity and mortality, through changes in patient and clinician behavior, and health system reorganization. [4]

Although the clinical manifestations of COVID-19 are dominated by respiratory symptoms, some patients have severe cardiovascular damage. [5] In addition, some patients with underlying cardiovascular diseases (CVDs) might have an increased risk of death. [5] Therefore, understanding the extent of damage caused by SARS-CoV-2 to the cardiovascular system and its effect on presentation is of the greatest importance, so that treatment of these patients can be timely and effective, and mortality reduced.

In this context, the interaction between COVID-19 and the cardiovascular system (CVS) has been a subject of special attention by the investigators. [6] Patients with pre-existing CVD, hypertension, or diabetes mellitus seem to be at increased risk of having severe form of the disease. The involvement of the CVS had already been described in other epidemics caused by COVID-19. [7] It has been reported that in COVID-19, patients with or at risk for CVD appear to be at a higher risk of disease with more severity and the patients needed intensive care unit (ICU), [8] and ultimately mortality. [6, 9, 10]

Generally, patients with coronary artery disease (CAD) and heart failure may be due to specific risk as a result of coronary plaque rupture

secondary to virally induced systemic inflammation, and rigorous use of plaque stabilizing agents (aspirin, statins, beta-blockers, and angiotensin-converting enzyme inhibitors), which has been suggested as a possible therapeutic strategy. [6] Pro-coagulant effects of systemic inflammation may increase the likelihood of stent thrombosis and assessment of platelet function and intensified anti-platelet therapy should be considered in those with a history of previous coronary intervention. [6]

In the event of prolonged or subsequent lockdowns, the risk of undiagnosed atrial fibrillation may also result in increased complications such as stroke, potentially translating into poorer outcomes in patients with atrial fibrillation during the COVID-19 pandemic. [11]

The clinical effects of pneumonia have been interconnected with the increased risk of CVD up to 10-years follow-up and it is likely that cases infected via respiratory virus outbreaks was experienced similar adverse outcomes. [10, 12] Lipid metabolism remained disrupted years after clinical recovery in few studies, whereas cardiac abnormalities observed during hospitalisation in some patients returned to normal at 1-year follow-up. [13,14]

A COVID-19 diagnosis revealed after few months the possible existence of residual left ventricular dysfunction and continuing inflammation, both of sufficient concern for representing a focus for new-onset of different cardiovascular complications and heart failure. [15] Moreover, it was recommended by the investigators that should not dismiss important other clinical pathophysiological observations such as clinical syndromes consistent with acute myocarditis, the cascade of immunologic responses, a prothrombotic milieu with microvascular clot formation, and/or myocardial injury due to supply-demand mismatch. [15] Considering the high expression of angiotensin converting enzyme (ACE)-2 in the CVS, especially on the myocardium, it can be proposed that ACE-2-related signaling pathways owing to COVID-19 might be played an important role to damage the CVS. [16]

Drug-related heart damage during COVID-19 treatment is a matter of great concern. In particular, the therapeutic use of corticosteroids and antiviral drugs should be monitored. Many antiviral drugs can cause cardiac insufficiency, arrhythmia or other cardiovascular disorders. Therefore, during treatment of COVID-19, especially use of antivirals, further augments the possibility of adverse cardiovascular events and therefore the risk of cardiac toxicity must be closely monitored. [17]

However, long-term follow-up data concerning the survivors of respiratory virus epidemics are scarce. Whilst viral phenotype, baseline clinical characteristics, initial disease severity, and immediate management impact on short-term survival, long-term prognosis following outbreaks of respiratory virus infection may equally depend upon the extra-pulmonary manifestations.

Although, the COVID-19 pandemic is an unprecedented hazard for worldwide health, reports of probable collateral effects of the widespread strategies for the prevention of the rapid spread of SARS-CoV-2 and to improve the burden on healthcare systems were reported in an earlier study. [18] Many countries, such as the Denmark, Austria, Italy, USA, and France, have found a considerable decline in hospital admissions for acute CVD viz. acute coronary syndrome, stroke, new-onset atrial fibrillation, and decompensated heart failure, and a substantial quantity of excess deaths not attributed to COVID-19 during the ongoing pandemic. [11, 19, 20, 21, 22] There has also been a great concern due to the societal lockdown and restructuring of healthcare systems with declining routine care may be conferred an increasing rate in deaths not due to COVID-19 in patients with established CVD. [18] Nevertheless, whether the probable collateral impacts of the COVID-19 lockdown may be extended to patients with recognized CVD has not been considered.

According to Adu-Amankwaah et al. [23] it is well-known fact that COVID-19 has adverse consequences on the CVS, what remains unknown is the pathomechanistic process in which it occurs. It is suggested some future studies that should be needed to clarify these underlying mechanisms. In addition, a better apprehension to know the

relationship between the COVID-19 and CVD development and management may have important implications in prognostication for patients with both COVID-19 and pre-existing CVD.

In a study by Harrison et al. [24] it was mentioned that the current understanding of CVD and results with COVID-19, the rapid expanse of investigation during the pandemic has been resulted the considerable variability of risk estimation and duplication of patient data. Certainly, this is particularly problematic when focussed on systematic reviews and meta-analyses, doubtfully the gold standard of scientific evidence, which have involved corresponding patient populations and represented a variety of evidence quality. Therefore, it was truly recommended serial follow-up studies about epidemiology of COVID-19.

The present study was attempted to determine the effect of COVID-19 pandemic on hospitalisation trends and outcome in cardiovascular disorders.

AIM AND OBJECTIVE

1. To determine the effect of COVID-19 pandemic on hospitalisation trends and outcome in cardiovascular disorders.

REVIEW OF LITERATURE

Outbreak of COVID-19

At the ending year of 2019, an outbreak of COVID-19 was reported in Wuhan, Hubei Province in China. [5, 25] The outbreak has developed a global pandemic and caused pneumonia. [25, 26] This virus was appeared to more contagious than severe acute respiratory syndrome (SARS) coronavirus (SARS-CoV) and Middle East Respiratory Syndrome (MERS) coronavirus (MERS-CoV). [26] By the ending of June 8, 2020, there have been more than 7,000,000 confirmed cases of COVID-19, with estimated nearly about 400,000 fatalities as per worldwide data. [26]

This viral outbreak of a mysterious pneumonia featured by fever, dry cough, and fatigue, and occasional gastrointestinal symptoms happened in a seafood wholesale wet market, the Huanan Seafood Wholesale Market, in Wuhan, Hubei, China. [5] The earlier outbreak was reported in the market in December 2019 and about 66% of the staffs involved in China. The market was shut down on January 1, 2020, after the announcement of an epidemiologic alert by the local health authority on December 31, 2019. Nevertheless, in the month of January thousands of people of different provinces such as Hubei, Zhejiang, Guangdong, Henan, Hunan, etc. and the cities viz. Beijing and Shanghai were infected by the extensive spreading of the disease. [27] Moreover, the disease travelled to other countries, such as Thailand, Japan, Republic of Korea, Viet Nam, Germany, United States, and Singapore. As of February 6, 2020, a total of 28,276 confirmed cases with 565 deaths globally were recognized by WHO, involving at least 25 countries. [28] The pathogen of the outbreak was later identified as a novel beta-coronavirus, named 2019 novel coronavirus (2019-nCoV) and remembered to mind the terrible memory of the severe acute respiratory syndrome (SARS-2003, caused by another beta-coronavirus) that occurred 17 years ago. [29]

Role of angiotensin-converting enzyme in COVID-19

SARS-CoV binds to cells expressing appropriate viral receptors, particularly angiotensin-converting enzyme 2 (ACE2). [26] Angiotensin-converting enzyme 2 is also expressed in the heart, providing a link between coronaviruses and the CVS. [30] Murine models and human autopsy samples demonstrated that SARS-CoV can be down-regulated myocardial and pulmonary ACE2 pathways, thereby mediating myocardial inflammation, lung oedema, and acute respiratory failure. [31] It was noted that pro-inflammatory cytokines are up-regulated in the lungs and other organs of SARS patients, and the systemic inflammatory response syndrome provided a probable mechanism for multi-organ failure (usually involving the heart) in severe cases. [32]

In other words, ACE2, a homolog of angiotensin-converting enzyme (ACE), which is expressed in a variety of human organs and tissues, has extensive biological activities and could be counteracted the negative role of the renin-angiotensin system (RAS) in many diseases. [26, 33, 34, 35] It was well-known fact that the spike protein of SARS-CoV-2 interacted with ACE2, as like of SARS-CoV, and COVID-19 was also reported a similar pathogenic mechanism like SARS.

The first step of viral infection was recorded after entry into host cells. A spike glycoprotein on the viral envelope of the COVID-19 can bind to specific receptors on the membrane of host cells. In earlier study, it was documented that ACE2 is a specific functional receptor for SARS-CoV. [36] Zhou et al. stated that SARS-CoV-2 could be entered ACE2-expressing cells, but not cells without ACE2 or cells expressing other coronavirus receptors, such as aminopeptidase N and dipeptidyl peptidase 4 (DPP4), confirming that ACE2 is the cell receptor for SARS-CoV-2.[2] Another study documented that the binding affinity of the SARS-CoV-2 spike glycoprotein to ACE2 is 10-fold to 20-fold higher than that of SARS-CoV to ACE2. [37]

Cardiovascular disease related to COVID-19

As per epidemiological analyses, it was established that COVID-19 patients suffered from severe multiple organ injuries, such as lungs,

kidneys and liver, which were also observed closely related to adverse outcome in CVDs. [38, 39, 40, 41]

As per earlier study, CVS complications such as myocarditis, acute myocardial infarction, and exacerbation of heart failure have been well-recognized after influenza infection, which confirmed a significant contribution to mortality. [42]

Sensitive systemic inflammatory and pro-coagulant activity could be persisted in survivors of hospitalization for community-acquired pneumonia long after resolution of the index infection. [10]

The higher proportion of harmful outcomes with COVID-19 for patients with CVD or cardiovascular risk factors may also be due to underlying alterations these risk factors have triggered on inflammatory pathways, immune function, and/or lung function. [24] Following outcomes of CVS complications by Influenza are as follows:

Firstly, Influenza and other upper respiratory infections may be resulted in CVS complications by causing a pro-inflammatory state. [43, 44] Similarly, dysregulation of coagulation and a hyperinflammatory response has been reported in some patients with COVID-19, which may cause a 'hypercoagulable state' and a propensity for thrombosis and thrombosis-related complications. [45, 46]

Secondly, CVS risk factors such as diabetes mellitus may be led to immune function dysregulation, which may be the chance of increasing susceptibility and predisposing these patients to severe presentation of COVID-19. [47]

Thirdly, some CVS risk factors including smoking and obesity may be impaired pulmonary function resulting with a higher risk of severe consequences with COVID-19. Both current and former smokers have accelerated lung function decline compared to never-smokers. [48] In addition, obesity may also be impaired lung function by pushing the diaphragm upward and reducing lung volume. [49]

A quickly emerging evidence-based study on COVID-19 has been suggested the following might be all increasing risk of severe COVID-19 or mortality with COVID-19, which included higher age group, male gender, black or African American or other ethnic minority families, and

underlying health circumstances while some features of CVD and CVS risk factors viz. hypertension, diabetes mellitus, and chronic kidney disease. [50, 51, 52, 53] Identifying CVS risk factors for impaired COVID-19 prognosis, which is important to detect high-risk patient groups and targeting of intervention strategies.

Many studies reported that the patients with acute coronary syndrome (ACS) who are infected with SARS-CoV-2 often have a poor prognosis. In patients with ACS, cardiac functional reserve could be reduced due to myocardial ischemia or necrosis. When infected with SARS-CoV-2, cardiac decompensation is found to occur, leading to a sudden deterioration in the condition of these patients. For patients with underlying heart disease, SARS-CoV-2 infection might be acted as a triggering factor to worsen the condition and may be led to death. [54, 55, 56]

Viral pathogenesis related to cardiovascular system

Chronic CVD may be enhanced as unstable in the setting of viral infection as a consequence of imbalance between infection-induced increasing trends in metabolic demand and reducing cardiac reserve. [10]

Several studies have shown that pandemic-induced but virus-independent effects lead to reduced hospital admissions for acute coronary syndrome (ACS), MI or PE, compared to admission rates before onset of the pandemic or compared to previous years. [19, 54-57] Controversy exists however, whether this decrease in admissions during the pandemic is associated with a parallel increase in mortality or complications, or whether these remain unaffected. [58, 59, 60] Given the significant incidence of acute coronary events and PE in the general population, a thorough evaluation of the frequency and potential causes of complications and mortality of cardiovascular emergencies is imperative to assess overall virus-dependent and–independent impact on cardiovascular emergencies during the COVID-19 associated pandemic.

A meta-analysis showed that MERS-CoV infection was more likely to occur in patients with underlying CVD. [61] In patients with MERS-CoV

infection and severe symptoms, 50% had hypertension and diabetes and up to 30% had heart disease. Similarly, according to the Pneumonitis Diagnosis and Treatment Program for New Coronavirus Infection (Trial Version 4), elderly people with comorbidities are more likely to be infected with SARS-CoV-2, especially those with hypertension, coronary heart disease or diabetes. Furthermore, patients with CVD are more likely to develop severe symptoms if infected with SARS-CoV-2. Therefore, patients with CVD account for a large proportion of deaths from COVID-19. In one study, among the patients with severe symptoms of COVID-19, 58% had hypertension, 25% had heart disease and 44% had arrhythmia. [5] According to mortality data released by the NHC, 35% of patients with SARS-CoV-2 infection had a history of hypertension and 17% had a history of coronary heart disease. Furthermore, data show that patients aged >60 years who were infected with SARS-CoV-2 had more systemic symptoms and more severe pneumonia than patients aged ≤60 years. [62] Therefore, in patients with SARS-CoV-2 infection, underlying CVD can aggravate the pneumonia and increase the severity of symptoms.

A recent study suggested that a fairly high number of false negative results for SARS-CoV-2 infection may be obtained in patients with few or no symptoms during the incubation period using currently available tests, and patients included in our study tested negative for SARS-CoV-2 were usually only tested at admission with no follow-up tests, thus leaving the possibility that an unknown but substantial number of patients may have had undetected SARS-CoV-2 infection. [63] Since increased mortality was driven by MI patients, and none of the tested MI patients that survived or died were SARS-CoV-2 positive, it is rather unlikely that a significant amount of patients may have been SARS-CoV-2 positive. Nevertheless, it remains to be discussed that viral respiratory infections have been proven to increase the risk of ACS as shown for influenza, implying also a potential direct effect of SARS-CoV-2 infections on ACS incidence and outcome during the COVID-19 pandemic. [64] While the incidence of ACS in patients with COVID-19 remains poorly understood, it has been proposed that plaque rupture,

coronary spasm or microthrombi owing to systemic inflammation or cytokine storm may trigger ACS in COVID-19 patients. [65] Activated macrophages may secrete collagenases, thereby degrading the fibrous cap of atherosclerotic plaques, which may lead to plaque rupture; activated macrophages may secrete tissue factor and promote thrombus formation when the plaque ruptures; coronary thrombus formation may also be increased by direct endothelial or vascular injury due to SARS-CoV-2 infection. [65-68] At least, it remains to be kept in mind that both COVID-19 and secondary effects of the pandemic may impact incidence and/or fatal outcome of MI and other cardiovascular diseases. Nevertheless, in view of the central role of inflammatory mediators in the complications of COVID-19, anti-inflammatory therapies merit careful clinical evaluation. Glucocorticoids and colchicine exert generalized anti-inflammatory actions and show promise in the treatment of patients with advanced COVID-19. [69,70] Statins have direct anti-inflammatory effects beyond their lipid-lowering actions, mediated by inhibition of prenylation of small G proteins or induction of transcription factors such as KLF-2 that promote homeostatic endothelial functions.[71] Non-randomized treatment with statins yielded preliminary retrospective evidence of improved outcomes in COVID-19, as well as reductions in biomarkers of inflammation. [72] Targeted inhibition of cytokines, major effectors of endothelial activation, represents a more focused approach than generalized anti-inflammatory agents. [73]

Incident cardiovascular complications following hospitalization with COVID-19 may be up to 25% depending on the complication, but further evidence is needed to determine the impact of COVID-19 on long-term cardiovascular health outcomes.[24] Many of the CVS risk factors associated with COVID-19 are modifiable. Clinicians and policy makers should consider that primary and secondary prevention strategies which improve cardiovascular health may also improve outcomes for people following COVID-19.

Literature studies

In 2022, Cannata et al. [73] studied to explore the excess in-hospital mortality, unrelated to COVID-19 infection, across a range of CVDs. They reviewed 15 studies in which the average in-hospital mortality rate was 10.4% (n = 974) in the COVID-19 group and 5.7% (n = 1026) in the comparator group (CV disease without SARS-CoV-2 infection). They compared with periods outside the COVID-19 pandemic, the pooled risk ratio (RR) displayed an increasing rate in-hospital mortality of about 62% during COVID-19 [95% confidence interval (CI) 1.20-2.20, P = 0.002]. They also observed with a declining in admission rate >50% during the COVID-19 pandemic observed the higher levels of mortality compared with those with <50% reduction [RR 2.74 (95% CI 2.43-3.10) vs. 1.21 (95% CI 1.07-1.37), P < 0.001]. The observed increased mortality was consistent across different CVD circumstances (P = 0.74 for interaction).

In 2021, Butt et al. [18] studied to investigate the mortality rates, overall and according to location, in patients with established CVD (i.e., a history of ischaemic heart disease, ischaemic stroke, heart failure, atrial fibrillation, or peripheral artery disease) before, during, and after these lockdown measures during COVID-19 pandemic. Their findings indicated that the overall, in-hospital, and out-of-hospital mortality rate in 2020 before lockdown was significantly lower compared with the same period in 2019 [adjusted incidence rate ratio (IRR) 0.91, 95% confidence interval (CI) CI 0.87–0.95; IRR 0.95, 95% CI 0.89–1.02; and IRR 0.87, 95% CI 0.83–0.93, respectively]. Moreover, the overall death rate during and after lockdown was not significantly different compared with the same period in 2019 (IRR 0.99, 95% CI 0.97–1.02). Nevertheless, the in-hospital death rate was lower and out-of-hospital mortality rate higher during and after lockdown compared with the same period in 2019 (in-hospital, IRR 0.92, 95% CI 0.88–0.96; out-of-hospital, IRR 1.04, 95% CI1.01–1.08).

In 2021, Shoaib et al. [74] hypothesized that a decline in admissions with heart failure during COVID-19 pandemic led to a common rise in mortality for patients with heart failure in the community. They used

“National Heart Failure Audit” data to identify 36,974 adults who had a hospital admission with a primary diagnosis of heart failure between February and May in 2018, 2019, or 2020. Their findings revealed that the hospital admissions for heart failure in 2018-19 averaged 160 per day but were decreased in 2020, reaching a nadir of 64 per day on 27 March 2020 [incidence rate ratio (IRR): 0.40, 95% confidence interval (CI): 0.38–0.42]. Between 1 February–2020 and 31 May–2020, there was a 29% decline in hospital mortalities related to heart failure (IRR: 0.71, 95% CI: 0.67–0.75; estimated decline of 448 mortalities), a 31% increase in heart failure mortalities at home (IRR: 1.31, 95% CI: 1.24–1.39; estimated excess 539), and a 28% increase in heart failure mortalities in care homes and hospices (IRR: 1.28, 95% CI: 1.18–1.40; estimated excess 189). All-cause, inpatient mortality was comparable in the COVID-19 and pre-COVID-19 periods [odds ratio (OR): 1.02, 95% CI: 0.94–1.10]. After hospital discharge, 30-days mortality was increased in 2020 compared to 2018/19 (OR: 1.57, 95% CI: 1.38–1.78).

In 2021, Nef et al. [75] evaluated the impact of the lockdown period in central Germany on overall and cardiovascular deaths due to refusal of admission. They studied on the information related to the total number of mortalities and causes of mortality, including cardiovascular death, were collected. Additionally, they compared the rates of hospitalization (n = 5178) for chronic coronary syndrome (CCS), acute coronary syndrome (ACS), and out of hospital cardiac arrest (OHCA) in 26 hospitals. Data on 5,984 mortalities happening between March 23, 2020 and April 26, 2020 were evaluated. In comparison to the reference non-pandemic period in 2019 (deaths: n = 5832), there was a non-significant increasing trend in all-cause mortality of about 2.6% [incidence rate ratio (IRR) 1.03, 95% confidence interval (CI) 0.99-1.06; p = 0.16]. Cardiovascular and cardiac deaths increased significantly by 7.6% (IRR 1.08, 95%-CI 1.01-1.14; p = 0.02) and by 11.8% (IRR 1.12, 95%-CI 1.05-1.19; p<0.001), respectively.

A study published in Lancet by He L et al [76] compared acute coronary syndrome (ACS) admissions during COVID-19 pandemic periods in

China. Study period was defined as December 1, 2019 to June 30, 2020, and control period was defined as December 1, 2018 to June 30, 2019.They found out admissions for ST-elevation myocardial infarction (STEMI), Non-ST-elevation myocardial infarction (Non-STEMI), and unstable angina (UAP) reduced by 38·0%, 41·0%, and 63·3% (*N* = 1953, 1991, 7664 between January 24, 2020 to June 30, 2020 vs. *N* = 3150, 3373, and 20,868 between January 24, 2019 to June 30, 2019) in study period. Percutaneous coronary intervention performed within 24 h were significantly more frequent during study period in patients with STEMI (37·9% vs. 31·7%, *P*<0·0001), but significantly less frequent in patients with Non-STEMI (7·9% vs. 9·5%, *P* = 0·049), and in patients with UAP (1·7% vs. 3·5%, *P*<0·0001). In-hospital mortality rates in patients with ACS were similar during the study period and the control period (3·1% vs 2·5%, *P* = 0·174 for STEMI; 2·7% vs 2·3%, *P* = 0·429 for Non-STEMI; 0·2% vs 0·1%, *P* = 0·222 for UAP). A fall by 23.9% for HF admissions was also observed during the seven months following the study period than equivalent period in 2019. They concluded that ACS admissions reduced significantly in Beijing; however, increase of HF admissions was not observed within seven months post-pandemic period, implying the pandemic didn't deteriorate the short-term prognosis for ACS.

In 2021, Sokolski et al.[77] studied among 15 centers from 12 countries in Europe, only 20,226 consecutive acute admissions to Emergency and Cardiology Departments in 2020 were due to acute coronary syndrome (ACS), acute heart failure (HF), arrhythmia, and pulmonary embolism compared with 30,158 in 2019 (incidence rate ratio [IRR] with 95% confidence interval [95%CI]: 0.66 [0.58-0.76]). Nevertheless, the risk of mortality was higher in 2020 (odds ratio (OR) = 4.1). Among patients with ACS, there were fewer admissions with unstable angina: 0.79 (0.66-0.94); non-ST segment elevation myocardial infarction: 0.56 (0.50-0.64); and ST-segment elevation myocardial infarction: 0.78 (0.68-0.89).

In 2020, Holt et al. [11] evaluated the incidence, patient characteristics, and related events associated with new-onset atrial fibrillation (AF)

during a national COVID-19 lockdown. They found a lower occurrence of new-onset AF during the 3 weeks of lockdown in comparison with the corresponding weeks in 2019 [incidence rate ratios with 95% confidence intervals (CIs) for the 3 weeks: 0.66 (0.56-0.78), 0.53 (0.45-0.64), and 0.41 (0.34-0.50), respectively]. Moreover, it was a 47% drop in total numbers (562 vs. 1053). The patients diagnosed during lockdown were younger and with a lower CHA2DS2-VASc score, while history of cancer, heart failure, and vascular diseases were more prevalent. During lockdown, about 5.3% of patients with new-onset AF suffered an ischaemic stroke and 2.7% died, compared with 4.3% and 1.3% patients during the corresponding 2019 period, respectively.

In 2020, De Luca et al. [78] studied on ISACS-STEMI COVID-19 retrospective registry to estimate the true impact of the COVID-19 pandemic on the treatment and outcome of patients with STEMI treated by primary percutaneous coronary intervention (PPCI), with identification of "at-risk" patient cohorts for failure to present or delays to treatment. They studied a total of 6,609 patients underwent PPCI in 77 centers, located in 18 countries. In 2020, during the pandemic, there was a significant reduction in PPCI as compared with 2019 (incidence rate ratio: 0.811; 95% confidence interval: 0.78 to 0.84; $p<0.0001$). The heterogeneity among centers did not find relation with the incidence of mortality due to COVID-19. A significant interaction was observed for patients with arterial hypertension, who were less frequently admitted in 2020 than in 2019. Moreover, the pandemic was related to a significant increase in door-to-balloon and total ischemia times, which may have contributed to the higher death rate during the pandemic.

Research gap

Further research should focus on the impact of multiple cardiovascular risk factors and other multi-morbidity associations with COVID-19, as cardiovascular risk factors rarely occur in isolation. Although evidence will be observational, further research should include appropriate adjustment for confounding factors including age, socioeconomic status, and ethnicity, which are established risk factors for COVID-19 severity.

MATERIALS AND METHODS

We conducted a retrospective and prospective hospital-based analysis of patients admitted under following cardiovascular diseases

- Ischemic Heart Disease (IHD)
- Pericardial disease
- Cardiomyopathy
- Valvular heart disease (Rheumatic, Congenital & Acquired)
- Arrhythmias
- Heart failure
- CVA
- Venous thromboembolism (DVT & PE)
- Peripheral arterial disease (PAD)
- Aortic Diseases (Dissection & Aneurysms)

Patients admitted with above illnesses from 1st April 2020 to 28th February 2022 was our study group and that from 1st March 2019 to 31st March 2020 was our control group. We compared their baseline characteristics, presentations, past co-morbid illnesses, associated systemic findings, treatment strategy opted, complications and outcome.

SOURCE OF DATA

Data collection was done by analyzing the records of admitted patient at HDHI unit of DMC & HOSPITAL.

METHOD OF COLLECTION OF DATA

INCLUSION CRITERIA: All patients admitted under following cardiovascular diseases from 1st March 2019 to 22nd February 2022.

- Ischemic Heart Disease (IHD)
- Pericardial disease
- Cardiomyopathy
- Valvular heart disease (Rheumatic, Congenital & Acquired)
- Arrhythmias
- Heart failure
- CVA
- Venous thromboembolism (DVT & PE)

- Peripheral arterial disease (PAD)
- Aortic Diseases (Dissection & Aneurysms)

EXCLUSION CRITERIA:

1. Patients admitted with other than cardiovascular and respiratory illness.
2. Patients who went DAMA from emergency department.

OUTCOME: We compared admission rates, past history, presenting illness, ecg & echocardiographic findings and in-hospital and all-cause mortality during pre covid and covid timeline for cardiovascular diseases.

STATISTICAL ANALYSIS:

Data is described in terms of range; mean ±standard deviation (± SD), frequencies (number of cases) and relative frequencies (percentages) as appropriate. To determine whether the data is normally distributed, a Kolmogorov-Smirnov test is used. Comparison of quantitative variables between the study groups is done using Mann Whitney U test for independent samples for non-parametric data. For comparing categorical data, Chi square (χ^2) test is performed and fisher exact test is used when the expected frequency is less than 5. A probability value (p value) less than 0.05 is considered statistically significant. All statistical calculations are done using (Statistical Package for the Social Science) SPSS 21version (SPSS Inc., Chicago, IL, USA) statistical program for Microsoft Windows

OBSERVATION AND RESULTS

The present research study was carried out at Dayanand Medical College and Hospital, Ludhiana. Within the specified study duration, a total of 18,095 cases who met our inclusion criteria were recruited to the study. These cases were categorized into two groups: Pre-Covid timeline, consisting of patients admitted between 1st March 2019 and 31st March 2020, and Covid timeline, comprising patients admitted between 1st April 2020 and 28th February 2022. Our objective was to assess the impact of the COVID-19 pandemic on the trends of hospitalizations and the outcomes of cardiovascular disorders

A retrospective and prospective hospital-based analysis was performed on patients who were admitted under following cardiovascular diseases:

- Ischemic Heart Disease (IHD)
- Pericardial disease
- Cardiomyopathy
- Valvular heart disease (Rheumatic, Congenital & Acquired)
- Arrhythmias
- Heart failure
- CVA
- Venous thromboembolism (DVT & PE)
- Peripheral arterial disease (PAD)
- Aortic Diseases (Dissection & Aneurysms)

The study was conducted for a period of three years (1st March 2019 to 28th February 2022).

The statistical analysis was performed by using SPSS tool (version 21.0). All the categorical variables were used for Chi square test to know the association of factors between Pre Covid and Covid timeline.

Timeline distribution for pre covid and covid duration

Table 1: Distribution of patients for pre covid and covid duration

Timeline	No. of cases	Percentage
Pre Covid (1st March 2019-31st March 2020)	8254	45.6%
Covid (1st April 2020-28 Feb 2022)	9841	54.4%
Total	18095	100.0%

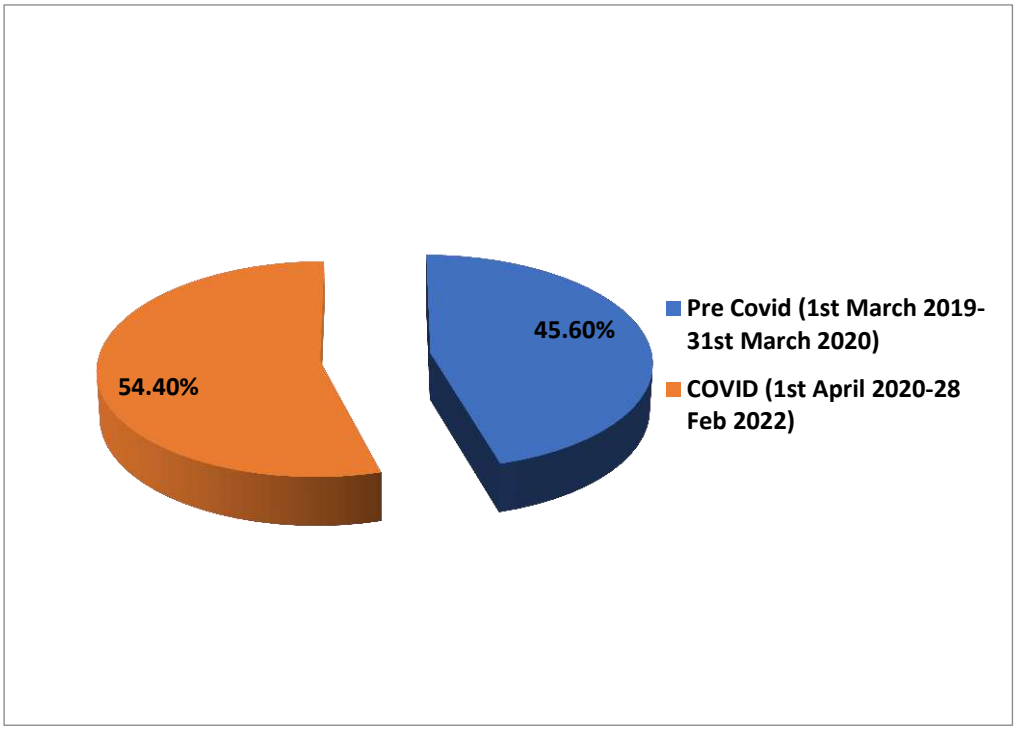

Fig 1: Distribution of patients for pre covid and covid duration.

Table 1 and Fig 1 presents the percentage distribution of the patients admitted under study during the pre covid and covid period. The pre-COVID timeline, spanning from 1st March 2019 to 31st March 2020, accounted for 8,254 (45.6%) patients. In contrast, the COVID timeline, covering the period from 1st April 2020 to 28th February 2022, included 9,841 (54.4%) patients.

Chi square test for factors association between pre covid and covid duration

Table 2: Factor as gender associated between pre covid and covid duration

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Sex	**No. of cases**	**Percentage**	**No. of cases**	**Percentage**					
Male	6573	66.8%	5364	65.0%	11937	6.517	0.011	1.080	1.02-1.15
Female	3268	33.2%	2890	35.0%	6158				

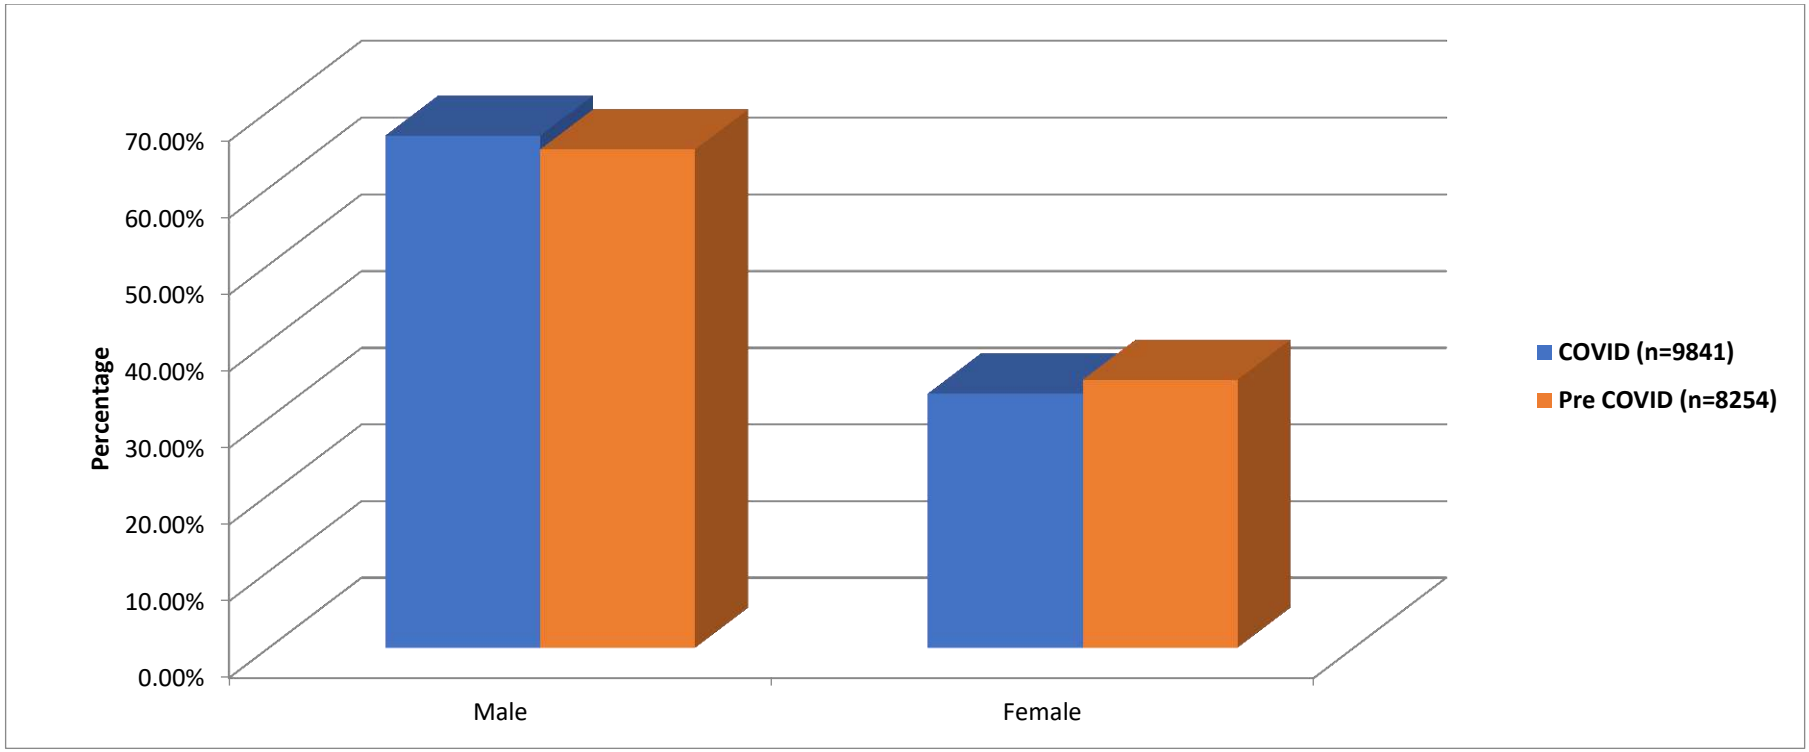

Fig 2: Factor as gender associated between pre covid and covid duration

Table 2 and Fig 2 describe the gender association between pre covid and covid duration. 66.8% of admitted patients during covid period were male whereas only 65% of admitted patients were male during pre covid period. The association is statistically significant (P=0.011).

Table 3: Factor as Geographical area associated between pre covid and covid duration

Geographical Area	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
Urban	7450	75.7%	5821	70.5%	13271	50.498	0.001	1.300	1.22-1.39
Rural	2391	24.3%	2433	29.5%	4824				

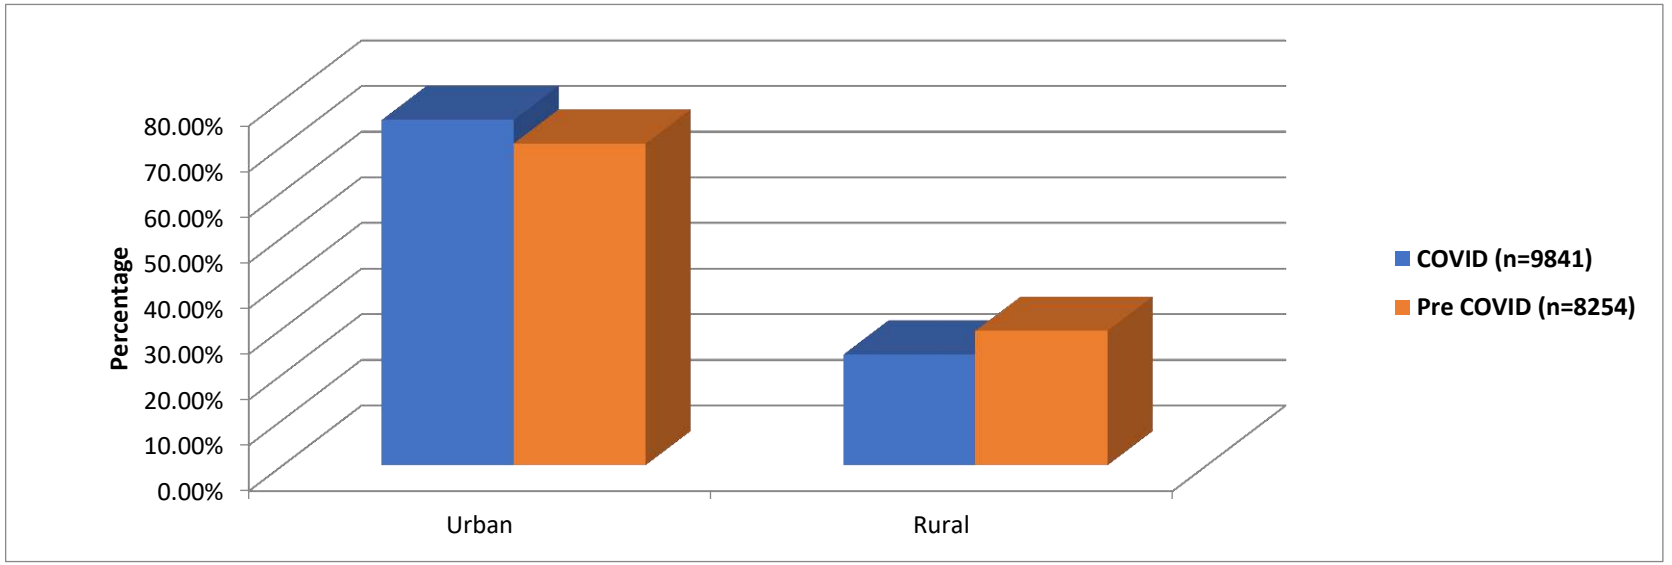

Fig 3: Factor as Geographical area associated between pre covid and covid duration

Table 3 and Fig 3 present the association of geographical area between the pre covid and COVID duration. It is observed that during the COVID period, 75.7% of the admitted patients were from urban areas, while in the pre-COVID period; only 70.5% of the admitted patients were from urban areas. Importantly, the association between the two variables is statistically significant (P<0.001), indicating a notable difference in the distribution of patients from urban areas before and during the COVID-19 pandemic

Table 4: Factors as past history associated between pre covid and covid duration

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Past History	**No. of cases**	**Percentage**	**No. of cases**	**Percentage**					
DM	4626	47.0%	3898	47.2%	8524	0.086	0.77	0.99	0.93-1.05
HTN	5141	52.2%	4125	50.0%	9266	9.216	0.002	1.09	1.03-1.16
Renal Dysfunction	1608	16.3%	1269	15.4%	2877	3.129	0.079	1.08	0.99-1.16
CAD	5098	51.8%	3402	41.2%	8500	202.008	0.001	1.53	1.45-1.63
Pericardial Disease	1	0.0%	1	0.0%	2	0.016	0.901	0.84	0.052-13.41
Cardiomyopathy	271	2.8%	216	2.6%	487	0.321	0.571	1.05	0.88-1.26
Rheumatic	44	0.4%	20	0.2%	64	5.342	0.024	1.85	1.09-3.14
Congenital	12	0.1%	6	0.1%	18	1.096	0.295	1.67	0.63-4.47
Degenerative	1	0.0%	3	0.0%	4	1.393	0.238	0.28	0.029-2.68
Arrhythmias	667	6.8%	579	7.0%	1246	0.393	0.531	0.96	0.86-1.08

Heart failure	3088	31.4%	2315	28.0%	5403	23.795	0.001	1.17	1.10-1.25
CVA	284	2.9%	256	3.1%	540	0.721	0.396	0.93	0.78-1.10
DVT	11	0.1%	18	0.2%	29	3.17	0.075	0.51	0.24-1.08
PE	11	0.1%	17	0.2%	28	2.577	0.129	0.54	0.25-1.16
Peripheral arterial disease	20	0.2%	24	0.3%	44	1.418	0.234	0.70	0.38-1.26
Aortic Diseases	1	0.0%	6	0.1%	7	4.539	0.052	0.14	0.02-1.16
Lung Disease	824	8.4%	766	9.3%	1590	4.61	0.033	0.89	0.81-0.99
Chronic Liver Disease	539	5.5%	325	3.9%	864	23.402	0.001	1.41	1.23-1.63

Table 4 describes the past history association between pre covid and covid duration. The association for HTN, CAD, Rheumatic heart disease, Heart failure, lung disease and chronic liver disease are statistically significant (P=0.002, P<0.001, P=0.024, P<0.001, P=0.033 and P<0.001). This indicates that patients who had history of hypertension, coronary artery disease, rheumatic heart disease, heart failure, lung disease and chronic liver disease were more frequently admitted during covid period.

Table 5: Factors as past history related to intervention associated between pre covid and covid duration

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Past history related to intervention	No. of cases	Percentage	No. of cases	Percentage					
PCI	940	9.6%	880	10.7%	1820	6.11	0.014	0.88	0.80-0.97
CABG	474	4.8%	486	5.9%	960	10.258	0.001	0.81	0.71-0.92
PACEMAKER	201	2.0%	159	1.9%	360	0.311	0.577	1.06	0.86-1.31
ICD	20	0.2%	40	0.5%	60	10.754	0.001	0.42	0.24-0.716
CRT	15	0.2%	9	0.1%	24	0.638	0.424	1.39	0.61-3.19
RFA	6	0.1%	14	0.2%	20	4.799	0.028	0.36	0.14-0.94
Balloon Valvotomy	22	0.2%	29	0.4%	51	2.608	0.106	0.64	0.36-1.11
Valve Replacement	127	1.3%	111	1.3%	238	0.102	0.75	0.96	0.74-1.24

Table 5 describes the past history related to intervention association between patients admitted during pre covid and covid duration. The association for PCI, CABG and ICD & RFA, are statistically significant (P=0.014, P<0.001, P<0.001 & P=0.028). This shows that patients who underwent PCI, CABG, ICD and RFA were more vulnerable for admission during covid period.

Table 6: Present admissions due to CAD during pre covid and covid period

Present admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Coronary Artery Diseases	No. of cases	Percentage	No. of cases	Percentage					
Chronic Stable Angina	472	4.8%	776	9.4%	1248	148.26	0.001	0.49	0.43-0.55
UA	1955	19.9%	1156	14.0%	3111	108.295	0.001	1.52	1.41-1.65
NSTEMI	3054	31.0%	2206	26.7%	5260	40.386	0.001	1.23	1.15-1.32
STEMI	1801	18.3%	1321	16.0%	3122	16.584	0.001	1.17	.108-1.27

.

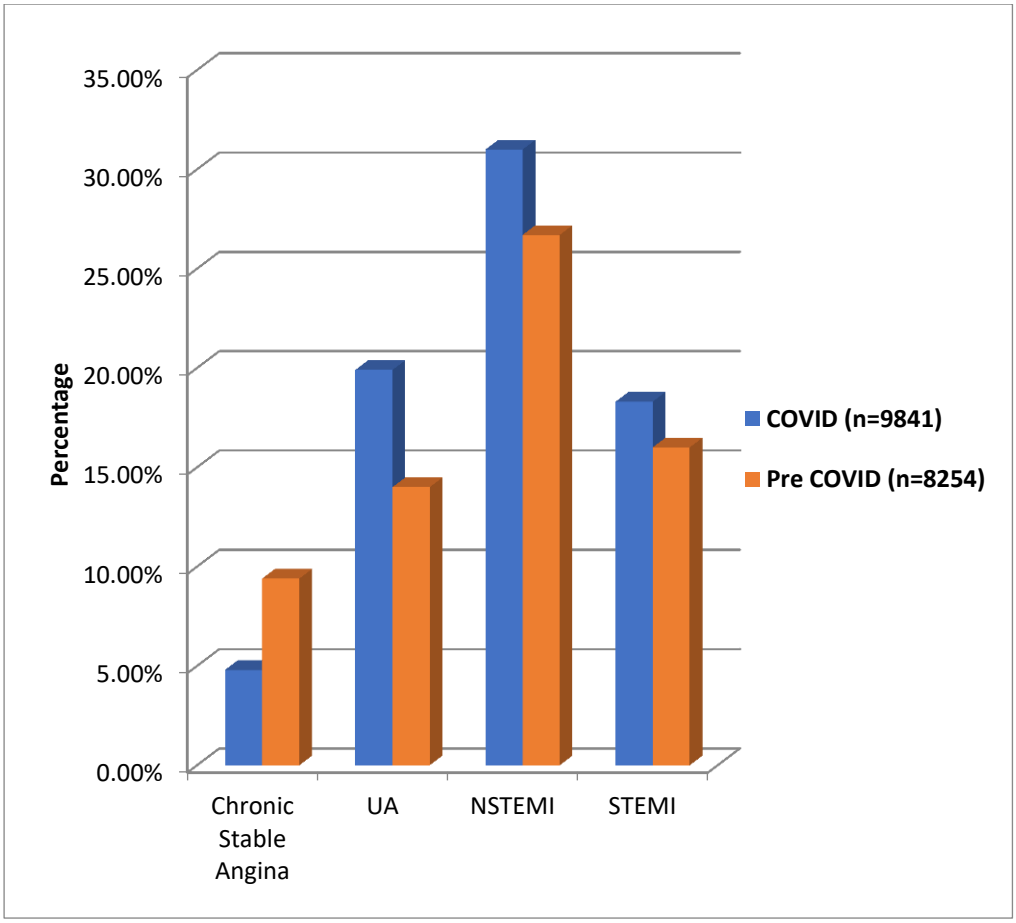

Fig 4: Present admissions due to CAD during pre covid and covid period

Table 6 and Fig 4 provides information on the admissions for coronary artery disease (CAD) during the pre-covid and covid period. The analysis reveals statistically significant associations ($P<0.001$) between the COVID period and admissions for chronic stable angina, unstable angina (UA), non-ST-segment elevation myocardial infarction (NSTEMI), and ST-segment elevation myocardial infarction (STEMI).

These findings indicate a significant increase in hospital admissions for CAD across its entire spectrum during the COVID-19 pandemic. This suggests that the pandemic has had a considerable impact on the incidence and severity of coronary artery disease, leading to higher rates of hospitalization for chronic stable angina, UA, NSTEMI, and STEMI.

Table 7: Present admissions due to pericardial diseases during pre covid and covid period

Present Admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Pericardial Diseases	No. of cases	Percentage	No. of cases	Percentage					
Acute Pericarditis	4	0.0%	1	0.0%	5	1.323	0.25	3.36	0.38-30.03
Constrictive Pericarditis	18	0.2%	7	0.1%	25	3.13	0.077	2.16	0.90-5.17
Pericardial effusion (&>/= Moderate)	114	1.2%	91	1.1%	205	0.125	0.723	1.05	0.79-1.39
Tamponade	58	0.6%	42	0.5%	100	0.53	0.467	1.16	0.78-1.73

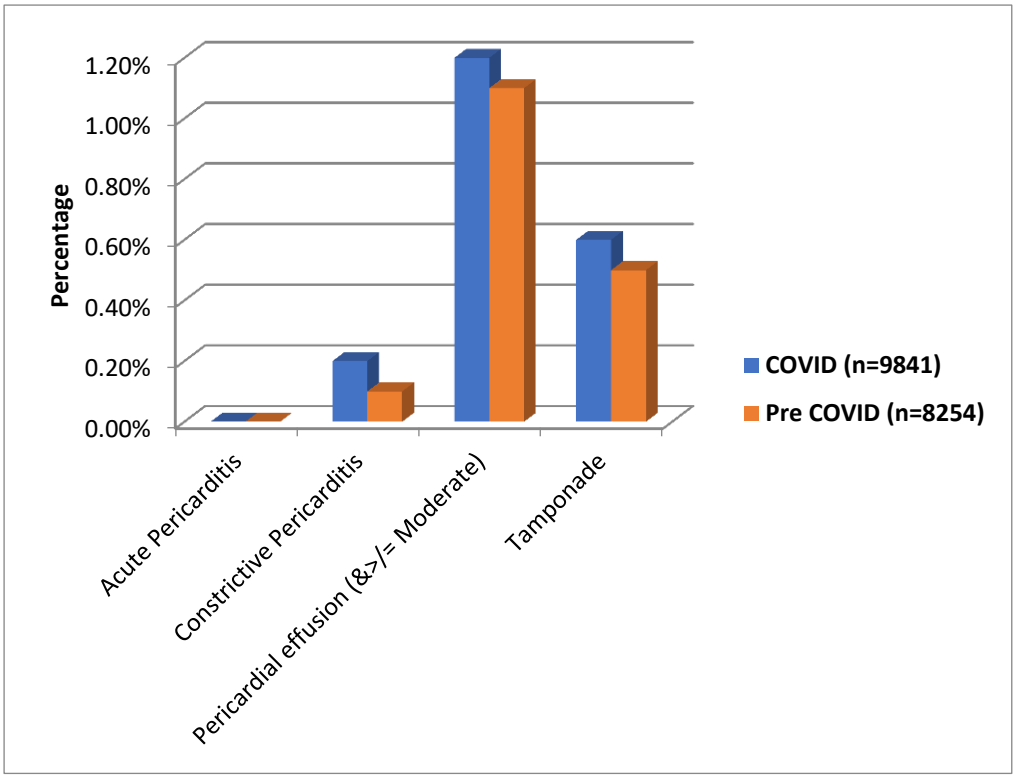

Fig 5: Present admissions due to pericardial diseases during pre covid and covid period.

Table 7 and Fig 5 describes the present admissions due to pericardial diseases during pre covid and covid period. The association for Acute Pericarditis, Constrictive Pericarditis, Pericardial effusion (>/= Moderate) and Tamponade are not statistically significant (P=0.25, P=0.077, P=0.723 and P=0.467).

Table 8: Present admissions due to cardiomyopathy during pre covid and covid period

Present Admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Cardiomyopathy	No. of cases	Percentage	No. of cases	Percentage					
Dilated	393	4.0%	345	4.2%	738	0.398	0.528	0.95	0.83-1.10
Restrictive	11	0.1%	8	0.1%	19	0.094	0.759	1.15	0.46-2.87
Hypertrophic	22	0.2%	35	0.4%	57	5.746	0.017	0.53	0.31-0.89

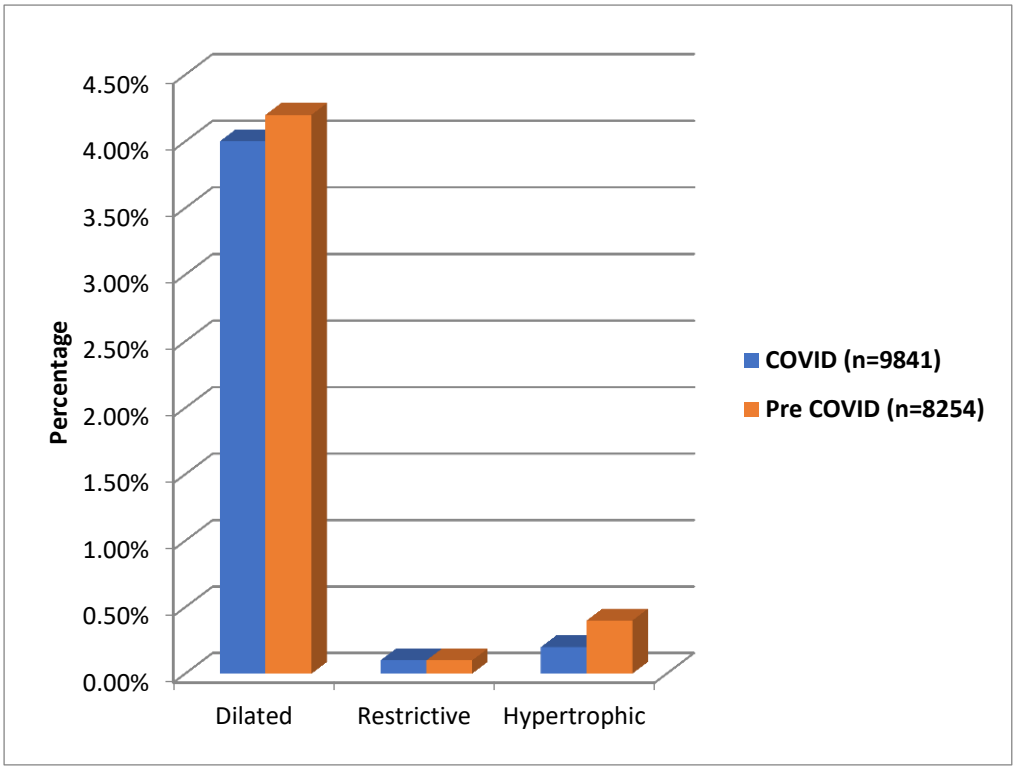

Fig 6: Present admissions due to cardiomyopathy during pre covid and covid period

Table 8 Fig 6 describes the present admissions due to cardiomyopathy during pre covid and covid period. The association for Dilated and Restrictive are not statistically significant (P=0.528 and P=0.759) while the association for Hypertrophic is statistically significant (P=0.017) implying that patients with hypertrophic cardiomyopathy were admitted less during covid period.

Table 9: Present admissions due to valvular heart diseases during pre covid and covid period

Present Admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Valvular heart diseases	No. of cases	Percentage	No. of cases	Percentage					
ACQUIRED	751	7.6%	865	10.5%	1616	131.997	0.001	.735	0.66-0.82
BICUSPID	30	0.3%	13	0.2%	43			1.954	1.02-3.75
CONGENITAL	102	1.0%	81	1.0%	183			1.066	0.79-1.4
DEGENERATIVE	495	5.0%	209	2.5%	704			2.005	1.70-2.36
RHEUMATIC	304	3.1%	178	2.2%	482			1.446	1.19-1.74

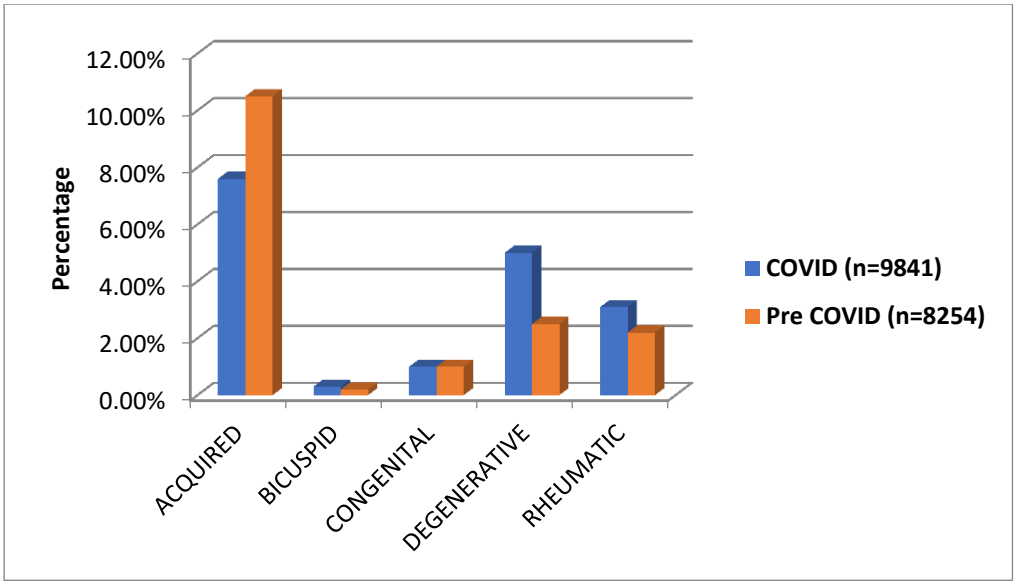

Fig 7: Present admissions due to valvular heart diseases during pre covid and covid period

Table 9 and Fig 7 present the admissions of patients with valvular heart diseases during the pre covid and covid duration. The analysis reveals a statistically significant association (P<0.001) between admissions for valvular heart disease during covid period.

During the COVID period, there was an increase in the number of patients admitted with both rheumatic and degenerative valvular heart diseases compared to the pre-COVID period. These findings indicate a notable shift in the pattern of valvular heart disease admissions following the COVID-19 pandemic.

Table 10: Present admissions according to type and nature of valve involvement during pre covid and covid period.

Present Admission		COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value
Valve		No. of cases	Percentage	No. of cases	Percentage			
Mitral Valve	SEVERE MR	261	2.7%	230	2.8%	491	4.497	0.343
	SEVERE MS	76	0.8%	56	0.7%	132		
	SEVERE MS, MODERATE MR	26	0.3%	12	0.1%	38		
	SEVERE MS, SEVERE MR	12	0.1%	8	0.1%	20		
Aortic Valve	SEVERE AR	61	0.6%	43	0.5%	104	12.46	0.029
	SEVERE AR, MODERATE AS	3	0.0%	5	0.1%	8		
	SEVERE AS	68	0.7%	58	0.7%	126		
	SEVERE AS, MODERATE AR	17	0.2%	21	0.3%	38		
	SEVERE AS, SEVERE AR	6	0.1%	18	0.2%	24		
Mixed Valvular	SEVERE AS, SEVERE AR	7	0.1%	5	0.1%	12	8.15	0.834
	SEVERE AS, SEVERE AR, SEVERE MR	0	0.0%	1	0.0%	1		

	SEVERE MR, SEVERE AS, SEVERE AR	1	0.0%	1	0.0%	2		
	SEVERE MR, SEVERE MS, SEVERE AR	0	0.0%	1	0.0%	1		
	SEVERE MR, SEVERE AR	13	0.1%	8	0.1%	21		
	SEVERE MR, SEVERE AS	4	0.0%	1	0.0%	5		
	SEVERE MS, SEVERE AS, MODERTAE AR	0	0.0%	1	0.0%	1		
	SEVERE MS, SEVERE AR	8	0.1%	6	0.1%	14		
	SEVERE MS, SEVERE MR	1	0.0%	1	0.0%	2		

Table 10 provides information on the nature and type of valve involvement in present admissions during the pre-covid and covid periods. The analysis reveals that there is a statistically significant association (P=0.029) between admissions with aortic valve disease and the covid timeline.

However, admissions with mitral valve disease and mixed valvular disease did not show statistical significance (P=0.343 and P=0.834, respectively). This suggests that the impact of the COVID-19 pandemic on hospital admissions differs depending on the specific type of valve involvement. While admissions for aortic valve disease were significantly affected, no significant changes were observed for mitral valve disease and mixed valvular disease between the pre-covid and COVID period.

Table 11: Present admissions due to arrhythmia during pre covid and covid period

Present Admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Arrhythmia	No. of cases	Percentage	No. of cases	Percentage					
PSVT	95	1.0%	85	1.0%	180	1.8902	0.663	0.94	0.69-1.26
AF	949	9.6%	681	8.3%	1630	10.624	0.001	1.19	1.07-1.32
CHB	311	3.2%	272	3.3%	583	0.263	0.608	0.96	0.81-1.13
Sinus node dysfunction	55	0.6%	70	0.8%	125	5.472	0.019	0.66	0.46-0.94
AV Block	152	1.5%	115	1.4%	267	0.707	0.421	1.11	0.87-1.42
VT	383	3.9%	342	4.1%	725	0.739	0.403	0.94	0.81-1.09

Table 11 displays the admissions for arrhythmia in both the pre-covid and covid periods. Atrial fibrillation (AF) was identified as the most prevalent arrhythmia during both periods. The incidence of AF increased during the COVID period, with 9.6% of admitted patients exhibiting AF compared to 8.3% in the pre-COVID period. These findings highlight the notable increase in AF incidence during the COVID period, which is statistically significant ($P<0.001$). In other words, the COVID-19 pandemic appears to have further increased the incidence of AF,

Statistical analysis also revealed significant association between sinus node dysfunction ($P=0.019$) in post covid admitted patients. Conversely, no significant associations were found for paroxysmal supraventricular tachycardia (PSVT), complete heart block (CHB), atrioventricular (AV) block, and ventricular tachycardia (VT) ($P=0.663$, $P=0.608$, $P=0.421$, and $P=0.403$, respectively), indicating that the prevalence of these specific arrhythmias was not significantly influenced by the COVID-19 pandemic.

Table 12: Present admissions due to heart failure during pre covid and covid period

Present Admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
ADHF	3214	32.7%	2702	32.7%	5916	0.012	0.924	0.99	0.94-1.06

Table 12 describes acute decompensated heart failure admissions during pre covid and covid period. The admissions for ADHF were same i.e. 32.7% during both periods. The association for ADHF is not statistically significant (P=0.924).

Table 13: Present admissions due to CVA during pre covid and covid period

Present Admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
CVA	No. of cases	Percentage	No. of cases	Percentage					
Ischemic	109	1.1%	118	1.4%	227	3.757	0.053	0.77	0.59-1.004
Haemorrhagic	31	0.3%	31	0.4%	62	0.482	0.487	8.38	0.51-1.38

Table 13 analyses the present admissions due to cerebrovascular accidents during pre covid and covid period. The association for admissions of Ischemic and Haemorrhagic CVAs are not statistically significant (P=0.053 and P=0.487).

Table 14: Present admissions due to VTE during pre covid and covid period

Present admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
VTE	No. of cases	Percentage	No. of cases	Percentage					
DVT	50	0.5%	60	0.7%	110	3.558	0.068	0.69	0.48-1.02
PE	46	0.5%	76	0.9%	122	13.776	0.001	0.51	0.35-0.73

Table 14 provides information on the admissions for Venous Thromboembolism (VTE) during the pre-covid and COVID period. The analysis reveals a statistically significant association ($P<0.001$) between admissions for Pulmonary Embolism (PE) and pre covid period.

However, the association between Deep Vein Thrombosis (DVT) and the timeline did not reach statistical significance ($P=0.068$). These findings suggest that there was a notable decrease in admissions for PE during the COVID period, indicating a significant impact of the pandemic on the incidence of this condition. On the other hand, the prevalence of DVT did not exhibit a significant change between the pre-covid and COVID periods

Table 15: Present admissions due to PAD during pre covid and covid period

Present Admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
PAD	No. of cases	Percentage	No. of cases	Percentage					
Chronic Limb Ischemia	1046	10.6%	1001	12.1%	2047	10.046	0.002	0.86	0.78-0.95
Acute Limb Ischemia	7	0.1%	10	0.1%	17	1.197	0.333	0.59	0.22-1.54
Critical Limb Ischemia	3	0.0%	5	0.1%	8	0.92	0.338	0.50	0.12-2.11

Table 15 presents the admissions for peripheral artery disease (PAD) during the pre-covid and COVID period. The analysis reveals that the most common reason for admissions related to PAD in both periods was chronic limb ischemia (CLI). However, it is noteworthy that the number of admissions for CLI declined during the COVID period.

The statistical analysis indicates a significant association (P=0.002) between admissions for chronic limb ischemia and the covid timeline. On the other hand, the associations between acute limb ischemia and critical limb ischemia with the timeline are not statistically significant (P=0.333 and P=0.038, respectively).

These findings suggest that while chronic limb ischemia remained the primary cause of admissions for PAD in both the pre-covid and COVID periods, there was a decline in the number of admissions for CLI during the COVID timeline. However, the associations

between acute limb ischemia and critical limb ischemia with the timeline did not reach statistical significance, indicating that the prevalence of these conditions did not significantly change between the two periods.

Table 16: Present admissions due to aortic diseases during pre covid and covid period

Present admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Aortic diseases	No. of cases	Percentage	No. of cases	Percentage					
Dissection	30	0.3%	11	0.1%	41	5.846	0.016	2.29	1.15-4.57
Aneurysms	67	0.7%	34	0.4%	101	5.848	0.017	1.66	1.09-2.51

Table 16 provides an analysis of admissions for aortic diseases during the pre-covid and COVID period. The findings reveal a significant increase in hospitalizations for Aortic Dissection and Aneurysms during the COVID period (P=0.016 and P=0.017, respectively).

These results indicate that the incidence of Aortic Dissection and Aneurysms has notably risen during the COVID period. The statistical significance of these associations further strengthens the evidence of an increased burden of aortic diseases following the COVID-19 pandemic.

Table 17: Present admissions due to LRTI during pre covid and covid period

Present admission	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
LRTI	1195	12.1%	1484	18.0%	2679	121.216	0.001	0.63	0.58-0.68

Table 17 describes the LRTI admissions between pre covid and covid timeline. This shows there is decrease in admissions for LRTI during covid period and this association for LRTI is statistically significant (P<0.001).

Table 18: Present admissions for SCD Survivor during pre covid and covid period

Present admissions	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
SCD Survivor	196	2.0%	206	2.5%	402	5.251	0.023	0.79	0.65-0.97

Table 18 provides information on the admissions for sudden cardiac death (SCD) survivors during the pre-covid and COVID periods. The analysis reveals that there were 2.5% admissions for SCD survivors during the pre-COVID period, whereas the percentage decreased to 2% during the COVID period. Importantly, this association between SCD survivor admissions and the COVID period is statistically significant (P=0.023).

These findings indicate a significant decrease in hospitalizations for SCD survivors during the COVID period compared to the pre-COVID period. The statistical significance of this association emphasizes the impact of the COVID-19 pandemic on the hospitalisation of SCD survivor.

Table 19: Troponin levels during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Investigation	**No. of cases**	**Percentage**	**No. of cases**	**Percentage**					
Troponin	4831	49.1%	3283	39.8%	8114	157.508	0.001	1.46	1.37-1.55

Table 19 provides an analysis of troponin levels during the pre-covid and COVID period. The results show that 49.1% of patients during the COVID period had positive troponin levels, correlating with higher incidence of coronary artery disease compared to the pre-COVID period.

The statistical analysis reveals a significant association between troponin levels and the COVID period ($P<0.001$). These findings suggest that the COVID-19 pandemic has had a significant impact on the prevalence of positive troponin levels, indicating a higher incidence of coronary artery disease among patients during the COVID period.

Table 20: ECG Rhythm during pre covid and covid period

ECG	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value
Rhythm [Sinus/AF/Pacemaker/AV dissociation/Junctional/PSVT/VT/ CHB/NSVT]	No. of cases	Percentage	No. of cases	Percentage			
AF	905	9.2%	643	7.8%	1548	26.522	0.022
AF, PSVT	2	0.0%	0	0.0%	2		
AV DISSOCIATION	23	0.2%	15	0.2%	38		
CHB	15	0.2%	17	0.2%	32		
JUNCTIONAL BRADYCARDIA	309	3.1%	261	3.2%	570		
PACEMAKER	86	0.9%	50	0.6%	136		
PACEMAKER, CHB	150	1.5%	104	1.3%	254		
PACEMAKER, VT	0	0.0%	1	0.0%	1		
PSVT	1	0.0%	0	0.0%	1		
SINUS	14	0.1%	17	0.2%	31		
VT	2	0.0%	1	0.0%	3		

Table 20 describes the ECG rhythm association between pre covid and covid duration. The analysis indicates a statistically significant (P=0.022) association between ECG rhythm and covid timeline.

During the covid period, there was increase in the number of patients admitted with AF, Junctional Bradycardia, Pacemaker, CHB compared to pre covid duration. These findings indicate a notable increase in the pattern of abnormal ECG rhythm in admissions following the COVID-19 pandemic

Table 21: ECG parameters during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
ECG	No. of cases	Percentage	No. of cases	Percentage					
AV Block	177	1.8%	149	1.8%	326	0.001	0.974	0.99	0.80-1.24
ST elevation	1801	18.3%	1303	15.8%	3104	19.975	0.001	1.20	1.11-1.29
ST depression / T wave inversion/ T Wave Flattening	5204	52.9%	3816	46.2%	9020	79.374	0.001	1.31	1.23-1.38
IVCD	32	0.3%	65	0.8%	97	40.98	0.001	0.41	0.26-0.62
LBBB	340	3.5%	400	4.8%	740			0.70	0.60-0.81
RBBB	342	3.5%	271	3.3%	613			1.04	0.88-1.22
Bi/Trifascicular	104	1.1%	85	1.0%	189	0.032	0.859	1.03	0.77-1.37

Table 21 presents an analysis of ECG parameters during the pre-covid and COVID periods. The findings demonstrate an increased incidence of ST-T changes and bundle branch blocks on ECG during the COVID period. These findings align with the increased incidence of coronary artery disease and positive troponin levels observed during the COVID period.

Statistical analysis reveals significant associations between the COVID period and ST elevation, ST depression/T wave inversion/T wave flattening, as well as bundle branch blocks including IVCD, LBBB, and RBBB ($P<0.001$). However, no statistically significant associations were found for AV block and Bi/Trifascicular blocks ($P=0.974$ and $P=0.859$).

These results suggest that the COVID-19 pandemic has significantly influenced ECG parameters, specifically the heightened occurrence of ST-T changes and bundle branch blocks during the COVID period. The statistical significance of these associations underscores the potential impact of the pandemic on cardiac electrical activity.

Furthermore, these findings align with the increased incidence of coronary artery disease and positive troponin levels, suggesting a potential link between the observed ECG changes and cardiac pathology associated with COVID-19.

Table 22: Echo findings during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Echo findings	**No. of cases**	**Percentage**	**No. of cases**	**Percentage**					
Diastolic dysfunction	1759	17.9%	948	11.5%	2707	144.0258	0.001	1.67	1.54-1.83
RV Dysfunction	194	2.0%	188	2.3%	382	2.039	0.153	0.86	0.70-1.06
PAH	200	2.0%	162	2.0%	362	0.193	0.908	1.035	0.84-1.28

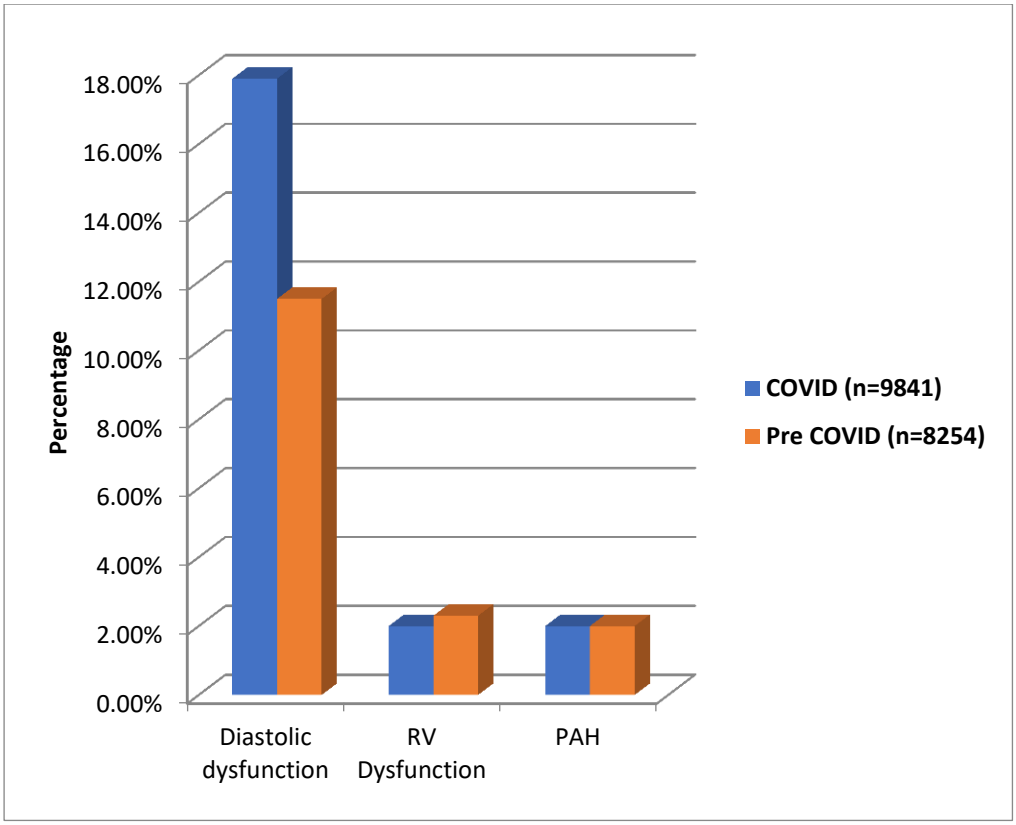

Fig 8: Echo findings during pre covid and covid period

Table 22 and Fig 8 presents an analysis of the association between Echo findings during the pre-covid and COVID periods. The results reveal that 17.9% of patients during the COVID period had diastolic dysfunction, whereas it was observed in 11.5% of patients during the pre-COVID period. This indicates an increased incidence of diastolic dysfunction among patients admitted during the COVID period.

Statistical analysis demonstrates a significant association between the COVID period and diastolic dysfunction ($P<0.001$). However, no statistically significant associations were found for right ventricular (RV) dysfunction and pulmonary arterial hypertension (PAH) ($P=0.153$ and $P=0.908$, respectively).

These findings indicate that the COVID-19 pandemic has had a significant impact on the incidence of diastolic dysfunction among patients. The statistical significance of this association highlights the potential influence of the pandemic on cardiac diastolic function

Table 23: Mean comparison of LVEF between pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Z	p-value	odd ratio	95% C.I.	
	Mean	SD	Mean	SD				Lower	Upper
LVEF	44.60	14.12	45.92	13.97	-6.465	0.001	0.99	0.99	1.00

Table 23 displays a lower mean left ventricular ejection fraction (LVEF) in the COVID group, indicating a statistically significant difference (P = 0.001) in LVEF between the pre-COVID and COVID groups.

Table 24: Echo findings related to valves during pre covid and covid period

Echo		COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value
Valve		No. of cases	Percentage	No. of cases	Percentage			
Aortic Valve	SEVERE AR	74	0.8%	49	0.6%	123	11.59	0.072
	SEVERE AR, MODERATE AR	1	0.0%	0	0.0%	1		
	SEVERE AR, MODERATE AS	10	0.1%	9	0.1%	19		
	SEVERE AS	66	0.7%	51	0.6%	117		
	SEVERE AS, MODERATE AR	23	0.2%	32	0.4%	55		
	SEVERE AS, SEVERE AR	14	0.1%	25	0.3%	39		
Mitral value	SEVERE MR	271	2.8%	237	2.9%	508	4.356	0.499
	SEVERE MR, MODERATE MS	11	0.1%	6	0.1%	17		
	SEVERE MS	75	0.8%	56	0.7%	131		
	SEVERE MS, MODERATE MR	32	0.3%	16	0.2%	48		
	SEVERE MS, SEVERE MR	12	0.1%	11	0.1%	23		

Table 24 describes the Echo findings related to valve involvement during pre covid and covid duration. The association for aortic valve and mitral valve are not statistically significant (P=0.072 and P=0.499).

Table 25: Patients underwent CAG during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
CAG (Yes)	4390	44.6%	3319	40.2%	7709	35.516	0.001	1.190	1.13-1.27

Table 25 presents the association between patients who underwent coronary angiography (CAG) during the pre-covid and COVID periods. The results indicate that 44% of patients during the COVID period underwent CAG, compared to 40.2% during the pre-COVID period. This suggests an increased utilization of coronary angiography among patients admitted during the COVID period. This corresponds to the increased incidence of coronary artery disease in covid group.

Statistical analysis reveals a significant association between the COVID period and patient undergoing CAG ($P<0.001$). These findings highlight the impact of the COVID-19 pandemic on the frequency of CAG procedures, with a higher proportion of patients undergoing CAG during the COVID period.

Table 26: CAG findings during pre covid and covid period

CAG findings	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
Normal	545	5.5%	424	5.1%	969	1.425	0.233	1.080	0.95-1.23
Non Critical	261	2.7%	176	2.1%	437	9.81	0.007	1.248	1.03-1.52
SLOW FLOW	20	0.2%	31	0.4%	51			0.543	0.31-0.95
SVD	949	9.6%	720	8.7%	1669	4.541	0.035	1.120	1.01-1.24
DVD	917	9.3%	724	8.8%	1641	1.63	0.202	1.070	0.96-1.18
TVD	1686	17.1%	1195	14.5%	2881	23.63	0.001	1.22	1.13-1.32

Table 26 presents the association between CAG findings during the pre-covid and COVID periods. The most prevalent finding observed is triple vessel disease, accounting for 17.1% in the COVID period compared to 14.5% in the pre-COVID period.

Statistical analysis reveals significant associations for non-critical and slow flow, single vessel disease (SVD), and triple vessel disease (TVD) ($P=0.007$, $P=0.035$, and $P<0.001$, respectively). However, no statistically significant associations were found for normal findings and double vessel disease (DVD) ($P=0.233$ and $P=0.202$, respectively).

The increased incidence of triple vessel disease during the COVID period suggests a potential association with the COVID-19 pandemic. These findings highlight the impact of the pandemic on the prevalence of specific CAG findings, particularly the higher occurrence of triple vessel disease.

Table 27: Intervention refusal by patient during pre covid and covid period

Intervention refusal	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
CAG	239	2.4%	225	2.7%	464	1.588	0.208	0.88	0.74-1.07
PCI	203	2.1%	191	2.3%	394	1.33	0.249	0.89	0.73-1.08
PACEMAKER	62	0.6%	58	0.7%	120	0.36	0.549	0.89	0.63-1.28
ICD	51	0.5%	22	0.3%	73	7.078	0.008	1.95	1.18-3.23
CABG	212	2.2%	213	2.6%	425	3.557	0.059	0.83	0.68-1.01
OTHER SURGERY	57	0.6%	58	0.7%	115	1.084	0.298	0.82	0.57-1.18

Table 27 presents the analysis of patient refusals for interventions during the pre-covid and COVID periods. The results indicate a statistically significant association for refusal of implantable cardioverter-defibrillator (ICD) in the post-COVID period (P=0.008). However, no statistically significant associations were found for refusals of coronary angiography (CAG), percutaneous coronary intervention (PCI), pacemaker, coronary artery bypass grafting (CABG), and other surgeries (P=0.208, P=0.249, P=0.549, P=0.059, and P=0.298, respectively). The absence of significant associations for other interventions indicates that the COVID-19 pandemic did not significantly impact the rates of refusal for CAG, PCI, pacemaker implantation, CABG, and other surgeries.

Table 28: Medical treatment for patients during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Treatment strategy	No. of cases	Percentage	No. of cases	Percentage					
OMT (yes)	5433	55.2%	5256	63.7%	10689	133.214	0.001	0.7	0.66-0.75

Table 28 presents the analysis of treatment strategies between the pre-covid and COVID periods. The findings reveal that 55.2% of patients during the COVID period received optimal medical therapy (OMT), compared to 63.7% in the pre-COVID period.

Statistical analysis indicates a significant association for OMT ($P<0.001$), underscoring the impact of the COVID-19 pandemic on treatment decisions. These findings shed light on the alterations in treatment strategies that occurred during the COVID-19 pandemic, emphasizing the need for continued monitoring and evaluation of the impact of the pandemic on healthcare delivery and patient care decisions.

Table 29: Thrombolysis Strategy during pre and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Thrombolysis Strategy	No. of cases	Percentage	No. of cases	Percentage					
Thromobolysis	384	3.9%	319	3.9%	703	0.017	0.897	1.010	0.87-1.18
Reteplase	13	0.1%	13	0.2%	26	13.075	0.655	0.839	0.39-1.81
STK	169	1.7%	98	1.2%	267		0.004	1.447	1.13-1.86
TNK	202	2.1%	208	2.5%	410		0.041	0.815	0.67-0.99

Table 29 describes the thrombolysis strategy during pre covid and covid period. There is no statistically significant difference between number of patients who were chosen for thrombolysis strategy during pre and post covid period. However, the choice of fibrinolytic agent has shown a statistically significant (P=0.004) association between usage of Streptokinase (STK) during covid period.

Table 30: Pharmacoinvasive Strategy during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Pharmacoinvasive	**No. of cases**	**Percentage**	**No. of cases**	**Percentage**					
Total	156	1.6%	66	0.8%	222	22.862	0.001	1.990	1.49-2.67
ELECTIVE	152	1.5%	58	0.7%	210	29.838	0.001	2.216	1.64-3.003
RESCUE	4	0.0%	8	0.1%	12			0.423	0.13-1.40
Reteplase	4	0.0%	3	0.0%	7	33.411	0.875	1.128	0.25-5.04
STK	42	0.4%	6	0.1%	48		0.001	5.922	2.52-13.94
TNK	113	1.1%	54	0.7%	167		0.001	1.770	1.28-2.45

Table 30 presents the analyses of the Pharmacoinvasive strategy chosen in the pre covid and COVID period. The results demonstrate a statistically significant association (P<0.001) of using Pharmacoinvasive strategy in the COVID period. This indicates that a greater number of patients underwent percutaneous coronary intervention (PCI) following thrombolysis in the COVID period.

Table 31: PCI Strategy during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
PCI Strategy	No. of cases	Percentage	No. of cases	Percentage					
PCI	1088	11.1%	795	9.6%	1883	9.765	0.002	1.166	1.06-1.28
ELECTIVE	1013	10.3%	656	7.9%	1669	60.063	0.001	1.316	1.18-1.46
PRIMARY	75	0.8%	139	1.7%	214		0.001	0.46	0.35-0.361

Table 31 presents an analysis of the percutaneous coronary intervention (PCI) during the pre-covid and COVID periods. The results reveal statistically significant associations for PCI and elective PCI (P=0.002 and P<0.001, respectively).

During the COVID period, there was a significant decrease in the utilization of primary PCI during the COVID period, with a rate of 0.8% compared to 1.7% in the pre COVID period. In contrast, there was a substantial increase in the utilization of elective PCI, with a rate of 10.3% in COVID compared to 7.9% in the pre COVID period.

These findings indicate a shift in the choice of PCI strategy during the COVID-19 pandemic, with a higher preference for elective interventions and a reduced utilization of primary PCI.

Table 32: Mechanical Support needed during pre covid and covid period

Mechanical Support	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
Mechanical support (IABP)	441	4.5%	239	2.9%	680	7.653	0.001	1.57	1.34-1.85
Mechanical Ventilation	581	5.9%	452	5.5%	1033	1.235	0.217	1.08	0.95-1.23

Table 32 describes the mechanical support needed during pre covid and covid duration. The association for mechanical support (IABP) in covid period is statistically significant (P<0.001) while the association for mechanical ventilation is not statistically significant (P=0.217). This indicates that a higher number of patients needed IABP support during covid period in comparison to pre covid period.

Table 33: Surgeries done during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Surgery	No. of cases	Percentage	No. of cases	Percentage					
CABG	1155	11.7%	727	8.8%	1882	41.319	0.001	1.37	1.25-1.52
ASD CLOSURE	33	0.3%	27	0.3%	60	0.009	0.924	1.05	0.62-1.71
BENTALL	10	0.1%	4	0.0%	14	1.641	0.284	2.098	0.66-6.69
CAROTID ENDARTECTOMY	11	0.1%	4	0.0%	15	2.73	0.195	2.31	0.73-7.25
CHD SURGERY	47	0.5%	13	0.2%	60	13.917	0.001	3.04	1.65-5.63

Table 33 presents an analysis of the associations between surgeries during the pre-covid and COVID periods. The results demonstrate statistically significant associations for coronary artery bypass grafting (CABG) and congenital heart disease (CHD) surgeries ($P<0.001$ for both), indicating a higher incidence of these procedures during the COVID period. However, no statistically significant associations were found for atrial septal defect (ASD) closure, Bentall procedure, and carotid endarterectomy ($P=0.924$, $P=0.284$, and $P=0.195$, respectively).

The findings suggest a notable increase in the utilization of CABG and CHD surgeries during the COVID period.

Table 34: Valvular intervention done during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Valvular intervention	No. of cases	Percentage	No. of cases	Percentage					
Valvotomy	12	0.1%	17	0.2%	29	1.981	0.159	0.592	0.28-1.24
Repair/ Replacement	248	2.5%	131	1.6%	379	19.054	0.001	1.603	1.29-1.98

Table 34 presents the analysis of the associations between valvular interventions during the pre-covid and COVID periods. The results reveal a statistically significant association for valve repair/replacement (P<0.001), indicating a higher incidence of these interventions during the COVID period. However, no statistically significant association was found for valvotomy (P=0.159).

Specifically, during the COVID period, 2.5% of cases underwent valve repair/replacement, compared to 1.6% during the pre-COVID period. This increase highlights the impact of the pandemic on valvular interventions, with a higher proportion of patients requiring repair/replacement procedures.

Table 35: Pericardiocentesis done pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
	No. of cases	Percentage	No. of cases	Percentage					
Pericardiocentesis	97	1.0%	76	0.9%	173	0.2	0.655	1.071	0.79-1.45

Table 35 describes the Pericardiocentesis association between pre covid and covid duration. The association for Pericardiocentesis is not statistically significant (P=0.655).

Table 36: Device therapy during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Device therapy	No. of cases	Percentage	No. of cases	Percentage					
TPI	379	3.9%	243	2.9%	622	11.131	0.001	1.32	1.12-1.56
PPI	310	3.2%	163	2.0%	473	24.358	0.001	1.61	1.33-1.96
ICD	22	0.2%	19	0.2%	41	0.009	0.925	0.97	0.53-1.79
CRT	13	0.1%	17	0.2%	30	1.48	0.224	0.641	0.31-1.32
RFA	36	0.4%	44	0.5%	80	2.853	0.093	0.685	0.44-1.065

Table 36 presents the analysis of the associations between device therapy during the pre-covid and COVID periods. The results indicate a statistically significant association for temporary pacemaker insertion (TPI) and permanent pacemaker insertion (PPI) ($P<0.001$) during the COVID period. However, no statistically significant associations were found for implantable cardioverter-defibrillator (ICD), cardiac resynchronization therapy (CRT), and radiofrequency ablation (RFA) ($P=0.925$, $P=0.224$, and $P=0.093$, respectively).

Specifically, during the COVID period, a higher proportion of patients (3.2%) required PPI compared to the pre-COVID period (2%). Similarly, the need for TPI was higher during the COVID period (3.9%) compared to the pre-COVID period (2.9%). These findings suggest an increased demand for device therapies among patients during the COVID period.

Table 37: Final Outcome during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value	odd ratio	95% CI
Outcome	No. of cases	Percentage	No. of cases	Percentage					
Death	840	8.5%	507	6.1%	1347	37.317	0.001	1.43	1.27-1.59

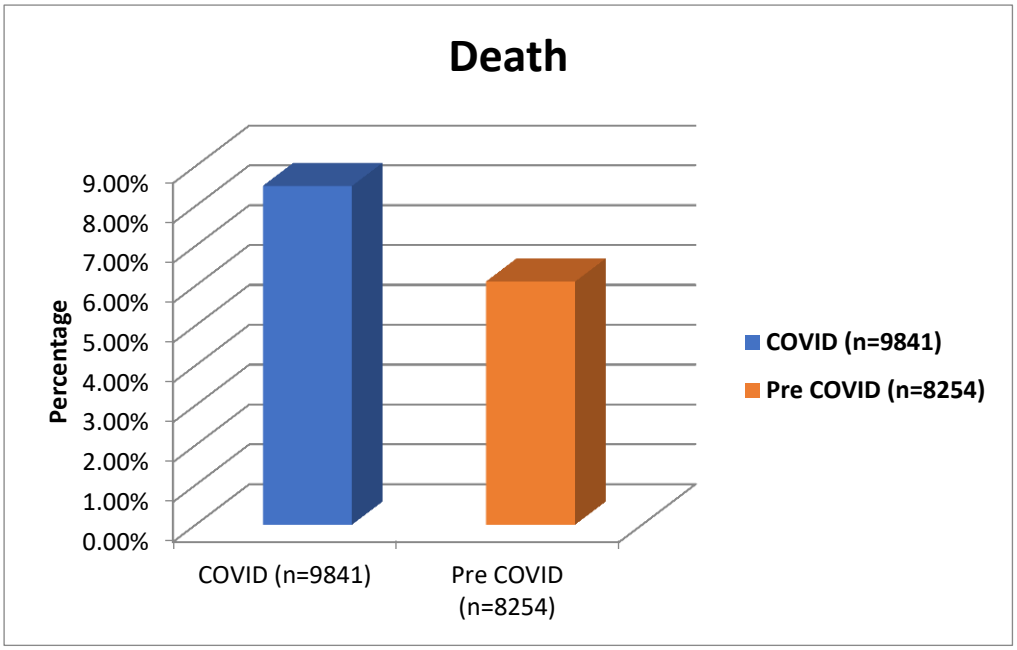

Fig 9: Final Outcome during pre covid and covid period

Table 37 and Fig 9 describe the death association between pre covid and covid duration. The association for death is statistically significant (P<0.001). The results clearly indicate that death was more at a rate of 8.5% during COVID compared to pre COVID (6.1%) period.

Table 38: All-cause mortality during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value
All-cause mortality	No. of cases	Percentage	No. of cases	Percentage			
CNS, CVS	0	0.0%	1	0.0%	1	53.424	0.001
CVS	779	7.9%	452	5.5%	1231		
CVS, GASTRO	0	0.0%	1	0.0%	1		
CVS, GUT	0	0.0%	1	0.0%	1		
CVS, NEURO	1	0.0%	2	0.0%	3		
CVS, SCD	2	0.0%	1	0.0%	3		
CVS, SYSTEMIC ILLNESS	31	0.3%	27	0.3%	58		
GASTRO	0	0.0%	1	0.0%	1		
GUT	0	0.0%	1	0.0%	1		
NEURO	0	0.0%	3	0.0%	3		
RS	1	0.0%	1	0.0%	2		
SCD	1	0.0%	1	0.0%	2		
SYSTEMIC ILLNESS	25	0.3%	15	0.2%	40		

Table 38 describes the all-cause mortality association between pre covid and covid duration. The association for overall parameters are statistically significant (P<0.001). The findings indicate that all-cause mortality rate related to CVS was higher at rate of 7.9% during COVID period compared to 5.4% during pre COVID period.

Table 39: Cardiac cause of mortality during pre covid and covid period

	COVID (n=9841)		Pre COVID (n=8254)		Total	Chi-square value	p-value
Cardiac cause mortality	No. of cases	Percentage	No. of cases	Percentage			
HF	353	3.6%	142	1.7%	495	91.043	0.001
MI	274	2.8%	140	1.7%	414		
SCD	152	1.5%	149	1.8%	301		
MECHANICAL COMPLICATION	30	0.3%	53	0.6%	83		
STROKE	5	0.1%	2	0.0%	7		

Table 39 describes the cardiac cause mortality association between pre covid and covid duration. The association for overall parameters are statistically significant (P<0.001). All these parameters such as Heart failure (HF), myocardial infraction (MI), sudden cardiac death (SCD), Mechanical complication and stroke were increased at the rate of 3.5%, 2.8%, 1.6%, 0.3% and 0.1% during COVID period compared to the rate of 1.7%, 1.8%, 1.8%, 0.7% and 0.0% during pre COVID period.

Table 40: Outcome among covid positive patients

COVID Test Samples (n=8725)					Total	Chi-square value	p-value	odd ratio	95% C.I.	
OUTCOME	POSITIVE		NEGATIVE						Lower	Upper
Death	36	11.8%	595	6.2%	631	9.711	0.002	1.75	1.23	2.51
Discharge	270	88.2%	7824	82.1%	8094					
Total	306	100.0%	8419	88.3%	8725					

Table 40 describe association between outcomes in covid positive patients admitted during covid timeline. Among the 306 COVID-19 positive patients from total 8725 test samples, 11.8% (36) died and 88.2% went home after discharge. Statistical analysis revealed a statistically significant difference (p=0.002) in mortality rates when compared to COVID-19 negative patients, where the mortality rate was 6.2%. Our study demonstrates a significant increase in mortality rates among COVID-19 positive patients admitted with cardiovascular diseases compared to COVID-19 negative patients. These findings underscore the direct impact of COVID-19 on patients with underlying cardiovascular conditions.

Table 41: Mean comparison of age and total duration of hospital stay between pre covid and covid duration

	COVID (n=9841)		Pre COVID (n=8254)		Z	p-value	odd ratio	95% C.I.	
	Mean	SD	Mean	SD				Lower	Upper
Age	61.06	13.24	61.18	13.22	-0.052	0.959	1.00	1.00	1.00
Total Duration of Hospital Stay (Days)	6.97	5.11	6.11	4.34	-12.314	0.001	1.04	1.03	1.05

Table 41 evaluates the mean comparison of age and total duration of hospital stay between pre covid and covid duration. The mean age comparison did not show significant (P=0.959) change while total duration of hospital stay is statistically significant (P<0.001). The results clearly reveal an increasing trend was observed for duration of hospital stay (days) during COVID (6.97 ± 5.11) period when compared to pre COVID period (6.11 ± 4.34).

Table 42: COVID Test Distribution

		COVID Timeline	
COVID test		No. of cases	Percentage
Rapid Ag (Total – 1611)	NEGATIVE	1596	99.1%
	POSITIVE	15	0.9%
RTPCR (Total – 8034)	NEGATIVE	7746	96.4%
	POSITIVE	288	3.6%
TRUENAT (Total – 401)	NEGATIVE	107	26.7%
	POSITIVE	294	73.3%

Table 42 describes the distribution of COVID test during COVID timeline. Total 1611 tests were performed by rapid antigen kit 1596 (99.1%) were observed negative and 15 (0.9%) were observed positive. During our covid timeline RT-PCR was performed total on 8034 times, it was positive on 288 (3.6%) instances and negative on 7746 (96.4%). Truenat was performed for total 401 times, it was observed positive on 294 (73.3%) cases and negative on 107 (26.7%) cases.

DISCUSSION

In our study, a total 18,095 numbers of cases were recruited in which 8254 cases (45.6%) were from Pre Covid duration i.e. 1st March 2019 to 31st march 2020 while 9841 cases (54.4%) were from Covid timeline i.e. 1st April 2020 to 28th Feb 2022 who presented with cardiovascular disease as per our inclusion criteria.

Butt et al. [18] studied a cohort consisting of 340,392 individuals in 2019 and 347,136 individuals in 2020. The cohort comprised Danish citizens who had cardiovascular disorders. Their study had a larger sample size compared to ours, but the study period was similar as ours.

Shoaib et al. [74] conducted an analysis on data related to hospital admissions with a diagnosis of heart failure in England. The study period ranged from January 1, 2018, to May 31, 2020. The researchers categorized study participants based on their date of index hospitalization, dividing them into the COVID-19 period (February 1 to May 31, 2020) and the pre-COVID-19 period (February 1 to May 31, 2018, and February 1 to May 31, 2019). They identified a total of 36,974 index events from the National Heart Failure audit (NHFA), with 27,183 (74%) occurring in the pre-COVID-19 period and 9,791 (26%) during the COVID-19 period. In contrast, our study on admissions for acute decompensated heart failure (ADHF) showed a consistent percentage of 32.7% during both periods and the association between ADHF and the COVID-19 period was not statistically significant (P=0.924). It is important to note that Shoaib et al. had a larger sample size compared to our study, and the study duration was similar during the COVID-19 pandemic period, while the non-pandemic or pre-COVID period had a higher duration compared to our present study.

In their scientific paper, Nef et al [75] conducted an analysis on the German population during the COVID-19 pandemic period, specifically from March 23rd to April 26th, 2020. The study focused on 2034 cases during this period, involving the participation of 22 out of 24 (92%) health authorities in the region. The data obtained during the COVID-19 pandemic period were compared to a reference non-pandemic

period in 2019, which consisted of 3545 cases from the same health authorities. Comparatively, our study samples had a higher sample size than the study conducted by Nef et al. However, the study duration was similar to both our study's COVID-19 pandemic period and pre-COVID period therefore it becomes important to consider the differences in sample size when interpreting the results and generalizing the findings.

In our scientific study, when considering the gender distribution, we found majority of admitted patients during both timelines were males. This observation aligns with similar findings reported in other studies. Butt et al. [18] also reported higher male admissions among Danish population who presented with cardiovascular disorders during covid timeline. Shoaib et al. [74] and Nef et al. [75] observed more admissions for males for both study periods, which is consistent with our study population.

In our study, we conducted an analysis to assess the association between past medical history and admissions during the pre-COVID and COVID timeline. We found that patients with a history of hypertension (HTN), coronary artery disease (CAD), rheumatic heart disease, heart failure, percutaneous coronary intervention (PCI), coronary artery bypass grafting (CABG), and implantable cardioverter-defibrillator (ICD) insertion had significant associations with admissions during covid period ($P=0.002$, $P<0.001$, $P=0.024$, $P<0.001$, $P=0.014$, $P<0.001$, and $P<0.001$, respectively). These findings are consistent with a study by Shoaib et al [74], which reported a significant association ($P<0.001$) between a history of CAD and admissions during covid period when comparing the pre-COVID and COVID periods. However, we did not observe significant changes in admissions for patients with past history of diabetes mellitus which differs from the findings in the German population, as per Nef et al. [75]

Our study indicated that there is statistically significant increase in admissions with coronary artery disease (across its entire spectrum), AF, rheumatic and degenerative valvular disease, and aortic disease during covid timeline. These findings are discordant with the study done by by He L et al. [76] They compared acute coronary syndrome

(ACS) admissions during COVID-19 pandemic periods in China. Study period was defined as December 1, 2019 to June 30, 2020, and control period was defined as December 1, 2018 to June 30, 2019.They concluded that ACS admissions reduced significantly in Beijing; however, increase of HF admissions was not observed within seven months post-pandemic period, implying the pandemic didn't deteriorate the short-term prognosis for ACS. This discordance can be attributed to the difference in the study periods of both studies. Ours included data for covid timeline for 23 months whereas they included 7 month data only.

In our study, we investigated the association between admissions during pre covid and covid timeline for troponin, and found a statistically significant association for troponin (P<0.001) for admissions during covid timeline. This finding is consistent with a study by Salvatici et al. [79] where they retrospectively evaluated high sensitivity cardiac troponin I (hs-TnI) values in 523 patients in a university hospital in Milan, Italy. They observed a significant difference in hs-TnI concentrations during covid admissions. The results from Salvatici et al.'s study align with our present study, indicating that troponin levels were higher in patients who presented with cardiovascular disease during the COVID timeline.

Out study analysed the ECG parameters association between pre covid and covid duration. The association for ST elevation, ST depression/T wave inversion/T and other parameters viz. IVCD, Left bundle branch block (LBBB) and Right bundle branch block (RBBB) are statistically significant (P<0.001) while the association for AV block and Bi/Trifascicular are not statistically significant (P=0.974 and P=0.859). Our study is supported by Barman et al. [80] that ECG is a good predictor during COVID-19 period. They estimated the ST depression (28% *vs.* 14%), T-wave inversion (29% *vs.* 16%), ST-T changes (36% *vs.* 21%), and the presence of fragmented QRS (fQRS) (17% *vs.* 7%) were more common in the COVID-19 group. Multivariate analysis indicated that hypertension (odds ratio [OR]: 2.42, 95% confidence interval [CI]:1.03–5.67; p = 0.041), the severity of COVID-

19 infection (OR: 1.87, 95% CI: 1.09–2.65; *p* = 0.026), presence of cardiac injury (OR: 3.32, 95% CI: 1.45–7.60; *p* = 0.004), and d-dimer (OR: 3.60, 95% CI: 1.29–10.06; *p* = 0.014) were independent predictors of ST-T changes on ECG.

In the present study, the association for Diastolic dysfunction with admissions during covid period is statistically significant (P<0.001) while the association for RV dysfunction and Pulmonary arterial hypertension (PAH) are not statistically significant (P=0.153 and P=0.908). Sun et al. [81] reported based on Echo findings that among COVID-19 patients, (21.3%) died during the index hospitalization in comparison with the other respiratory illness (11.8%) with a significant (p=0.001) difference. Independent of COVID-19, mild and moderate to severe RV dilation were associated with 1.4-2.0 folds higher risk of inpatient mortality, respectively (95%CI 1.17 to 1.69; p=0.0003; 95%CI 1.62 to 2.47; p<0.0001, respectively). In the same way, mild and moderate RV dysfunction were associated with 1.4-1.7 folds higher risk of inpatient mortality (95%CI 1.10 to 1.77; p=0.007; 95% CI 1.17 to 2.42; p=0.005, respectively). In this study, RV dysfunction was significantly associated with covid, which was replicated in our study.

We analysed percutaneous coronary interventions (PCI) during the pre-covid and covid period. The results revealed statistically significant associations for elective PCI (P<0.001) for admissions during covid timeline indicating a reduction for primary PCI during covid timeline. A survey by Adlan et al.[82] was performed among 43 UK primary PCI centres and a significant reduction was found in the number of cath labs open (pre-COVID 3.6±1.8 *vs*. post-COVID 2.1±0.8; p<0.001) and only 64% of cath labs remained open during covid timeline leading to less number of primary PCI consistent with our study.

Our study analysed the mechanical support needed during pre covid and covid timeline. The association for IABP use during covid period is statistically significant (P<0.001) while the association for mechanical ventilation is not statistically significant (P=0.217). Showkathali et al. [83] studied the impact of COVID-19 on acute coronary syndrome (ACS) admission during strict lockdown in a tertiary referral hospital in

India. They categorized the study period as during covid (25th March to 31st May 2020) and pre-covid (2019). In their findings, IABP did not show significant difference between the study periods which is a discordant finding with us.

In the present study, the association for coronary artery bypass grafting (CABG) and congenital heart disease (CHD) both were observed statistically significant (P<0.001 and P<0.001) while the association for ASD closure, Bentall and Carotid Endartectomy did not come statistically significant (P=0.924, P=0.284 and P=0.195). Our findings observed a notable increase in the utilization of CABG and CHD surgeries during the COVID period. Showkathali et al. [83] concluded that there was no significant association between CABG between pre COVID and COVID pandemic timeline. This finding is also in contrast to our study could be attributed to differences in the study period, patient populations, and other contextual factors.

In our study, the all-cause mortality association between pre covid and covid timeline indicated that the association for overall parameters are statistically significant (P<0.001). Butt et al. [18] reported that the overall, in-hospital, and out-of-hospital mortality rate in 2020 before lockdown was significantly lower (4.2%) compared with the same period in 2019 (4.3%) [adjusted incidence rate ratio (IRR) 0.91, 95% confidence interval (CI) CI 0.87–0.95; IRR 0.95, 95% CI 0.89–1.02; and IRR 0.87, 95% CI 0.83–0.93, respectively] due to CVD. The overall mortality rate during and after lockdown was not significantly different compared with the same period in 2019 (IRR 0.99, 95% CI 0.97–1.02) due to CVD. But our findings reveal all-cause mortality rate related to CVS was comparatively higher at rate of 7.9% during COVID period compared to 5.4% during pre COVID period.

Nef et al. [75] studied that from March 23rd to April 26th, 2020, a total of 5984 deaths were registered by the participating public health authorities in central Germany (Hesse) during the analyzed lockdown period. In comparison, during the similar non-pandemic period in 2019, the number of deaths was 5,832, resulting in a non-significant increase in all-cause mortality by 2.6% [incidence rate ratio (IRR) 1.03, 95%

confidence interval (CI) 0.99–1.03; $p = 0.02$]. But our study represents higher incidence of all-cause mortality at a rate of 7.9% during COVID period compared to 5.4% during pre COVID period.

In the present study, the cardiac cause of mortality was analysed between pre covid and covid period. The association for overall parameters are statistically significant (P<0.001). All these parameters such as Heart failure (HF), myocardial infarction (MI), sudden cardiac death (SCD), Mechanical complication and stroke were increased at the rate of 3.5%, 2.8%, 1.6%, 0.3% and 0.1% during COVID period compared to the rate of 1.7%, 1.8%, 1.8%, 0.7% and 0.0% during pre COVID period.

Shoaib et al. [74] observed an increasing trend of deaths due to heart failure during COVID period in comparison with the pre-COVID period. In total, they estimated an excess of 280 deaths from heart failure during the COVID-19 study period. In our study, a similar observation was noted related to heart failure (HF) during the COVID period.

In our study, the outcome especially death is observed more during covid period. The association for death is statistically significant (P<0.001). The results clearly indicate that death was maximum at a rate of 8.5% during COVID compared to pre COVID (6.1%) period.

A close similarity was observed by Shoaib et al. [74] in which they observed death within 30 days from admission was higher in the COVID-19 vs. pre-COVID-19 period (15% vs. 13%, OR: 1.15, 95% CI: 1.07–1.23). A lower proportion of patients in the COVID-19 vs. pre-COVID-19 period had heart failure as a principal cause of death as per the death certificate (48.3% vs. 53.3%) and a higher proportion, as assumed, had COVID-19 as a principal cause of death (9.6% vs. 0).

Cannata et al. [73] studied to explore the excess in-hospital mortality, unrelated to COVID-19 infection, across a range of CVDs. They reviewed 15 studies in which the average in-hospital mortality rate was 10.4% (n = 974) in the COVID-19 group and 5.7% (n = 1026) in the comparator group (CV disease without SARS-CoV-2 infection). They compared with periods outside the COVID-19 pandemic, the pooled risk ratio (RR) displayed an increasing rate in-hospital mortality of

about 62% during COVID-19 [95% confidence interval (CI) 1.20-2.20, P = 0.002]. They also observed with a declining in admission rate >50% during the COVID-19 pandemic observed the higher levels of mortality compared with those with <50% reduction [RR 2.74 (95% CI 2.43-3.10) vs. 1.21 (95% CI 1.07-1.37), P < 0.001]. The observed increased mortality was consistent across different CVD circumstances (P = 0.74 for interaction). Our study findings are also in agreement that during covid period there was increase in the mortality in patients who were admitted with cardiovascular disorders compared to pre COVID period.

SUMMARY & CONCLUSION

The COVID-19 pandemic has had a notable impact on hospitalizations and outcomes for various cardiovascular diseases. Individuals with pre-existing cardiovascular conditions have been found to be at higher risk of severe illness and adverse outcomes when infected with the SARS-CoV-2 virus. COVID-19 can exacerbate existing cardiovascular conditions, leading to increased hospitalizations, complications, and even mortality. Additionally, there have been reports of new-onset cardiovascular complications associated with COVID-19, such as myocardial infarction, atrial fibrillation and thromboembolic episodes.

It is crucial to identify patients with both chronic cardiovascular diseases and new cases that may have been undiagnosed during the COVID-19 pandemic. Timely diagnosis, appropriate management, and close monitoring of cardiovascular patients are essential to mitigate the adverse impact of COVID-19.

The impact of COVID-19 on hospitalizations and outcomes for various cardiovascular diseases has underscored the urgent need for public health measures, comprehensive screening approaches, and psychological support. It is crucial to raise awareness among individuals with cardiovascular conditions about the increased risk posed by COVID-19 and the importance of adherence to preventive measures.

Furthermore, the pandemic has shed light on the persistent inequalities in healthcare access and outcomes, including those related to age, sex and geographic location. Efforts to address these disparities and strengthen health systems are crucial for improving the overall cardiovascular health outcomes, especially during the ongoing pandemic and beyond.

In conclusion, the impact of COVID-19 on hospitalizations and outcomes for various cardiovascular diseases emphasizes the need for a multi-faceted approach that encompasses public health measures, effective vaccination strategies, targeted screening, and addressing health inequalities. These efforts are essential for minimizing the

adverse effects of COVID-19 on cardiovascular health and ensuring better outcomes for individuals with cardiovascular diseases.

LIMITATIONS

1. Follow-up studies are required to examine the long-term consequences of the pandemic on various aspects. The current study focused on a specific timeframe and may not capture the full extent of the aftermath of the pandemic. Future research should consider conducting follow-up studies to gain a comprehensive understanding of the on-going effects of the pandemic.
2. Our study did not investigate the effects of vaccination as the introduction of vaccines occurred towards the later part of the study duration. Therefore, the impact of vaccination on the outcomes studied was not assessed. Further research should be conducted to evaluate the influence of vaccination on the variables of interest.
3. The analysis in our study did not encompass the impact of different waves of COVID-19. Initially, the behavior of the pandemic was uncertain, and the study design did not anticipate multiple waves. Consequently, the specific effects associated with different waves of the virus were not analyzed. Future investigations should consider incorporating multiple waves to gain a comprehensive understanding of the variations in outcomes across different phases of the pandemic

FUTURE DIRECTION OF RESEARCH

1. Long-term Follow-up Studies: Conducting longitudinal studies with extended follow-up periods will provide insights into the long-term consequences of COVID-19 on cardiovascular diseases. These studies can help determine the persistence of cardiovascular complications, the development of new cardiovascular conditions, and the impact on overall cardiovascular health beyond the acute phase of the illness.
2. Risk Stratification and Severity Assessment: Further research is needed to identify and validate risk stratification tools and

severity assessment criteria specific to COVID-19 and cardiovascular diseases. Developing standardized methods to evaluate the severity of cardiovascular complications associated with COVID-19 will aid in better patient management and resource allocation.

3. Health Systems and Policy Research: Examining the health system response to the impact of COVID-19 on cardiovascular diseases is crucial. Investigating the healthcare delivery models, resource allocation strategies, and policy interventions that optimize patient outcomes and reduce the burden on healthcare systems will provide valuable insights for managing future pandemics or healthcare crises.

No. BFUHS/2K21p-TH/ 11

Date : 5/11/21

The Principal,
DMC, Ludhiana.

Subject: **Approval of Plan of Thesis.**

This is to inform you that the Faculty of Medical Sciences in its meeting held on 29.10.2021 has approved the plan of thesis of **Sushil Kumar**, a student of your college for **DM Cardiology** along with the names of Supervisor/Co-Supervisor as under:-

Topic Plan of Thesis

Impact of COVID-19 pandemic on hospitalisation trends and outcome of cardiovascular disorders; an observational study.

Supervisor

Dr. Gurpreet Singh Wander
Prof. & Head,
Dept. of Cardiology,
DMCH, Ludhiana.

Co-Supervisor

Dr. Bishav Mohan
Prof.,
Dept. of Cardiology,
DMCH, Ludhiana.

Dr. Bhupinder Singh
Assoc. Prof.,
Dept. of Cardiology,
DMCH, Ludhiana.

The student has to submit the four copies of thesis (along with PDF format) , to the Controller of Examinations, BFUHS, Faridkot, at least six months before the commencement of theory examination, if he/she is otherwise eligible to take the examination. He /She must directed to attach a photocopy of this letter with the forwarding letter while submitting thesis to the University along with the letter of approval of University for change of supervisor/Co-Supervisor, change of topic,(if any).

S P Singh

Dr. S P Singh MS(Oph)
Controller of Examinations

Note :

157. If any discrepancy found regarding topic of thesis or Supervisor/Co-Supervisor, inform undersigned within one month after issue of this letter.

158. The student may submit the thesis as per the schedule already conveyed i.e for May/June examination 30th Nov of the preceding the year of examination and for Nov/Dec examinations 31st May of the year of examination.

IMPACT OF COVID-19 PANDEMIC ON HOSPITALISATION TRENDS AND OUTCOME OF CARDIOVASCULAR DISORDERS; AN OBSERVATIONAL STUDY

THESIS PROPOSAL

FOR APPROVAL OF SUBJECT OF THESIS TO BE SUBMITTED

IN PARTIAL FULFILMENT OF THE REQUIREMENTS

FOR THE DEGREE OF

DOCTORATE OF MEDICINE

IN

CARDIOLOGY

ABSTRACT OF PLAN OF THESIS

Title	Impact of COVID-19 pandemic on hospitalisation trends and outcome of cardiovascular disorders; An Observational study
For the degree of	D.M Cardiology
Name of the candidate	Dr Sushil Kumar
Supervisor	Dr Gurpreet Singh Wander, Professor & Head, Department of Cardiology, DMCH, Ludhiana
Co-supervisors	Dr Bishav Mohan, Professor, Department of Cardiology, DMCH, Ludhiana Dr Bhupinder Singh, Associate Professor, Department of Cardiology, DMCH, Ludhiana
Institution	Dayanand Medical College & Hospital, Ludhiana
University	Baba Farid University of Health Sciences, Faridkot

Introduction: Although the clinical manifestations of COVID-19 are dominated by respiratory symptoms, some patients have severe cardiovascular damage. In addition, some patients with underlying cardiovascular diseases might have an increased risk of death.

Aim of Study:

1. To determine the effect of COVID-19 pandemic on hospitalisation trends and outcome in cardiovascular disorders.

Materials & Methods: We will be conducting an Observational study hospital-based analysis of patients admitted for cardiovascular diseases. Patients admitted from March 2020 to February 2022 will be our study group and those from March 2019 to February 2020 will be our control group. We will be comparing their baseline characteristics, presentations, past co-morbid illnesses, associated systemic findings, treatment strategy opted, complications and outcome.

Clinical Significance: To understand the changing trends in admissions, presentation and treatment strategy caused by SARS-CoV-2 on cardiovascular diseases.

Keywords: Covid 19, Cardiovascular, PCI, Thrombolysis

CERTIFICATE OF FACILITIES AVAILABLE

This is to certify that the facilities for work on the subject of thesis titled **"IMPACT OF COVID-19 PANDEMIC ON HOSPITALISATION TRENDS AND OUTCOME OF CARDIOVASCULAR DISORDERS; AN OBSERVATIONAL STUDY"** exist in the Department of Cardiology, DMC&H, and Ludhiana and will be provided to the candidate. We will see that the data being included in the thesis is genuine and is collected by the candidate himself under our supervision and guidance.

PROFORMA FOR REGISTRATION OF SUBJECT FOR DISSERTATION

1	NAME OF THE CANDIDATE AND ADDRESS	Dr. SUSHIL KUMAR
2	NAME OF THE INSTITUTE	DAYANAND MEDICAL COLLEGE AND HOSPITAL LUDHIANA
3	COURSE OF STUDY AND SUBJECT	DM CARDIOLOGY
4	DATE OF ADMISSION OF COURSE	30th December 2020
5	TITLE OF THE TOPIC	Impact of COVID-19 pandemic on hospitalisation trends and outcome of cardiovascular disorders; An Observational study

6 BRIEF RESUME OF THE INTENDED WORK

6.1 NEED FOR THE STUDY

Beyond direct effects of the COVID-19 on populations in every country, the pandemic had and will continue to have indirect effects on morbidity and mortality, through changes in patient and clinician behavior, and health system reorganization.

Although the clinical manifestations of COVID-19 are dominated by respiratory symptoms, some patients have severe cardiovascular damage [1].

In addition, some patients with underlying cardiovascular diseases (CVDs) might have an increased risk of death [1]. Therefore, understanding the extent of damage caused by SARS-CoV-2 to the cardiovascular system and its effect on presentation is of the greatest importance, so that treatment of these patients can be timely and effective and mortality reduced.

Patients with coronary artery disease and heart failure may be at particular risk as a result of coronary plaque rupture secondary to virally induced systemic inflammation, and rigorous use of plaque stabilizing agents (aspirin, statins, beta-blockers, and angiotensin-converting enzyme inhibitors) has been suggested as a possible therapeutic strategy. Pro-coagulant effects of systemic inflammation may increase the likelihood of stent thrombosis and assessment of platelet function and intensified anti-platelet therapy should be considered in those with a history of previous coronary intervention.

In the event of prolonged or subsequent lockdowns, the risk of undiagnosed atrial fibrillation may also result in increased complications such as stroke, potentially translating into poorer outcomes in patients with atrial fibrillation during the COVID-19 pandemic [2].

The clinical effects of pneumonia have been linked to increased risk of cardiovascular disease up to 10-year follow-up and it is likely that cases infected via respiratory virus outbreaks will experience similar adverse outcomes. Lipid metabolism remained disrupted years after clinical recovery in few studies, whereas cardiac abnormalities

observed during hospitalisation in some patients returned to normal at 1-year follow-up.

Months after a COVID-19 diagnosis, the possibility exists of residual left ventricular dysfunction and ongoing inflammation, both of sufficient concern to represent a nidus for new-onset heart failure and other cardiovascular complications. Moreover, we cannot dismiss important other clinical pathophysiological observations, including clinical syndromes consistent with acute myocarditis, the cascade of immunologic responses, a prothrombotic milieu with microvascular clot formation, and/or myocardial injury due to supply-demand mismatch. Considering the high expression of ACE2 in the cardiovascular system, especially on the myocardium, it can be proposed that ACE2-related signalling pathways owning to COVID-19 might play a chief role in damaging the cardiovascular system.

Drug-related heart damage during COVID-19 treatment is a concern. In particular, the therapeutic use of corticosteroids and antiviral drugs should be monitored. Many antiviral drugs can cause cardiac insufficiency, arrhythmia or other cardiovascular disorders. Therefore, during treatment of COVID-19, especially use of antivirals, further augments the possibility of adverse cardiovascular events and therefore the risk of cardiac toxicity must be closely monitored [3].

However, long-term follow-up data concerning the survivors of respiratory virus epidemics are scarce. Whilst viral phenotype, baseline clinical characteristics, initial disease severity, and immediate management impact on short-term survival, long-term prognosis following outbreaks of respiratory virus infection may equally depend upon the extra-pulmonary manifestations.

Although the COVID-19 pandemic is an unprecedented threat to global health in recent time, reports of potential collateral effects of the widespread strategies to prevent the rapid spread of SARS-CoV-2 and to alleviate the burden on healthcare systems are emerging. For example, several countries, including the USA, Italy, France, Austria, and Denmark, have observed a substantial decline in hospital admissions for acute cardiovascular diseases, such as acute coronary

syndrome, stroke, new-onset atrial fibrillation, and decompensated heart failure, and a considerable proportion of excess deaths not attributed to COVID-19 during the ongoing pandemic. There has also been concern that the societal lockdown and reorganization of healthcare systems with reduced routine care may confer an increase in deaths not due to COVID-19 in patients with established cardiovascular diseases. However, whether the potential collateral effects of the COVID-19 lockdown may extend to patients with established cardiovascular diseases has not been investigated.

Although it is clear that COVID-19 has adverse outcomes on the cardiovascular system, what remains unknown is the pathomechanistic process in which it occurs. Therefore, several studies are needed to clarify these underlying mechanisms. Additionally, a better apprehension of the relationship between the COVID-19 and CVD progression and management will have vital implications in prognostication for individuals with both COVID-19 and pre-existing CVD. Despite our current understanding of CVD and outcomes with COVID-19, the rapid expanse of research during the pandemic has resulted in substantial variability of risk estimates and duplication of patient data. Indeed, this is particularly problematic when focusing on systematic reviews and meta-analyses, arguably the gold standard of scientific evidence, which have included overlapping patient populations and represent a variety of evidence quality. Therefore, Serial follow-up studies about epidemiology of COVID-19 are sorely needed.

6.2 REVIEW OF LITERATURE

In December 2019, an outbreak of pneumonia caused by a novel coronavirus occurred in Wuhan, Hubei province, and has spread rapidly throughout China, with an ongoing risk of a pandemic [4]. After virus identification and isolation, the pathogen for this pneumonia was originally called 2019 novel coronavirus (2019-nCoV) [5] but has subsequently been officially named severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) by the WHO. On 30 January 2020, the WHO declared the outbreak of SARS-CoV-2 a Public Health Emergency of International Concern.

SARS-CoV binds to cells expressing appropriate viral receptors, particularly angiotensin-converting enzyme 2 (ACE2). Angiotensin-converting enzyme 2 is also expressed in the heart, providing a link between coronaviruses and the cardiovascular system. Murine models and human autopsy samples demonstrate that SARS-CoV can down-regulate myocardial and pulmonary ACE2 pathways, thereby mediating myocardial inflammation, lung oedema, and acute respiratory failure. Pro-inflammatory cytokines are up-regulated in the lungs and other organs of SARS patients, and the systemic inflammatory response syndrome provides a possible mechanism for multi-organ failure (usually involving the heart) in severe cases. Heightened systemic inflammatory and pro-coagulant activity can persist in survivors of hospitalization for community-acquired pneumonia long after resolution of the index infection.

The higher proportion of adverse outcomes with COVID-19 for patients with CVD or cardiovascular risk factors may also be due to underlying changes these risk factors have caused on inflammatory pathways, immune function, and/or lung function. First, Influenza and other upper respiratory infections may result in cardiovascular complications by causing a pro-inflammatory state. Similarly, dysregulation of coagulation and a hyperinflammatory response has been reported in some patients with COVID-19, which may cause a ‘hypercoagulable state’ and a propensity for thrombosis and thrombosis-related complications. Second, cardiovascular risk factors such as diabetes

mellitus may lead to immune function dysregulation, which may in turn increase susceptibility and predispose these patients to severe presentation of COVID-19. Third, some cardiovascular risk factors including smoking and obesity may impair pulmonary function resulting in a higher risk of severe outcomes with COVID-19. Both current and former smokers have accelerated lung function decline compared to never-smokers. Additionally, obesity may also impair lung function by pushing the diaphragm upward and reducing lung volume.

A rapidly emerging evidence base of COVID-19 research has suggested the following may all increase risk of severe COVID-19 or mortality with COVID-19: higher age, male sex, black or African American or other ethnic minority backgrounds, and underlying health conditions, including CVD and cardiovascular risk factors (e.g. hypertension, diabetes mellitus, and chronic kidney disease). Identifying cardiovascular risk factors for worsened COVID-19 prognosis is important to identify high-risk patient groups and targeting of intervention strategies.

Patients with acute coronary syndrome (ACS) who are infected with SARS-CoV-2 often have a poor prognosis. In patients with ACS, cardiac functional reserve can be reduced owing to myocardial ischemia or necrosis. When infected with SARS-CoV-2, cardiac decompensation is more likely to occur, leading to a sudden deterioration in the condition of these patients. For patients with underlying heart disease, SARS-CoV-2 infection might act as a precipitating factor to worsen the condition and may lead to death [6-8].

Chronic cardiovascular disease may become unstable in the setting of viral infection as a consequence of imbalance between infection-induced increase in metabolic demand and reduced cardiac reserve.

Several studies have shown that pandemic-induced but virus-independent effects lead to reduced hospital admissions for acute coronary syndrome (ACS), MI or PE, compared to admission rates before onset of the pandemic or compared to previous years[6,7-10]. Controversy exists however, whether this decrease in admissions during the pandemic is associated with a parallel increase in mortality

or complications, or whether these remain unaffected [11-13]. Given the significant incidence of acute coronary events and PE in the general population, a thorough evaluation of the frequency and potential causes of complications and mortality of cardiovascular emergencies is imperative to assess overall virus-dependent and–independent impact on cardiovascular emergencies during the COVID-19 associated pandemic.

A meta-analysis showed that MERS-CoV infection was more likely to occur in patients with underlying CVD [14]. In patients with MERS-CoV infection and severe symptoms, 50% had hypertension and diabetes and up to 30% had heart disease. Similarly, according to the Pneumonitis Diagnosis and Treatment Program for New Coronavirus Infection (Trial Version 4), elderly people with comorbidities are more likely to be infected with SARS-CoV-2, especially those with hypertension, coronary heart disease or diabetes. Furthermore, patients with CVD are more likely to develop severe symptoms if infected with SARS-CoV-2. Therefore, patients with CVD account for a large proportion of deaths from COVID-19. In one study, among the patients with severe symptoms of COVID-19, 58% had hypertension, 25% had heart disease and 44% had arrhythmia [1]. According to mortality data released by the NHC, 35% of patients with SARS-CoV-2 infection had a history of hypertension and 17% had a history of coronary heart disease. Furthermore, data show that patients aged >60 years who were infected with SARS-CoV-2 had more systemic symptoms and more severe pneumonia than patients aged ≤60 years[15]. Therefore, in patients with SARS-CoV-2 infection, underlying CVD can aggravate the pneumonia and increase the severity of symptoms.

A recent study suggests that a fairly high number of false negative results for SARS-CoV-2 infection may be obtained in patients with few or no symptoms during the incubation period using currently available tests, and patients included in our study tested negative for SARS-CoV-2 were usually only tested at admission with no follow-up tests, thus leaving the possibility that an unknown but substantial number of

patients may have had undetected SARS-CoV-2 infection[16]. Since increased mortality was driven by MI patients, and none of the tested MI patients that survived or died were SARS-CoV-2 positive, it is rather unlikely that a significant amount of patients may have been SARS-CoV-2 positive. Nevertheless, it remains to be discussed that viral respiratory infections have been proven to increase the risk of ACS as shown for influenza, implying also a potential direct effect of SARS-CoV-2 infections on ACS incidence and outcome during the COVID-19 pandemic[17]. While the incidence of ACS in patients with COVID-19 remains poorly understood, it has been proposed that plaque rupture, coronary spasm or microthrombi owing to systemic inflammation or cytokine storm may trigger ACS in COVID-19 patients[18]. Activated macrophages may secrete collagenases, thereby degrading the fibrous cap of atherosclerotic plaques, which may lead to plaque rupture; activated macrophages may secrete tissue factor and promote thrombus formation when the plaque ruptures; coronary thrombus formation may also be increased by direct endothelial or vascular injury due to SARS-CoV-2 infection [18-21]. At least, it remains to be kept in mind that both COVID-19 and secondary effects of the pandemic may impact incidence and/or fatal outcome of MI and other cardiovascular diseases. Nevertheless, In view of the central role of inflammatory mediators in the complications of COVID-19, anti-inflammatory therapies merit careful clinical evaluation. Glucocorticoids and colchicine exert generalized anti-inflammatory actions and show promise in the treatment of patients with advanced COVID-19 [22, 23] . Statins have direct anti-inflammatory effects beyond their lipid-lowering actions, mediated by inhibition of prenylation of small G proteins or induction of transcription factors such as KLF-2 that promote homeostatic endothelial functions. Non-randomized treatment with statins yielded preliminary retrospective evidence of improved outcomes in COVID-19, as well as reductions in biomarkers of inflammation. Targeted inhibition of cytokines, major effectors of endothelial activation, represents a more focused approach than generalized anti-inflammatory agents.

Incident cardiovascular complications following hospitalization with COVID-19 may be up to 25% depending on the complication, but further evidence is needed to determine the impact of COVID-19 on long-term cardiovascular health outcomes. Many of the cardiovascular risk factors associated with COVID-19 are modifiable. Clinicians and policy makers should consider that primary and secondary prevention strategies which improve cardiovascular health may also improve outcomes for people following COVID-19.

Further research should focus on the impact of multiple cardiovascular risk factors and other multi-morbidity associations with COVID-19, as cardiovascular risk factors rarely occur in isolation. Although evidence will be observational, further research should include appropriate adjustment for confounding factors including age, socioeconomic status, and ethnicity, which are established risk factors for COVID-19 severity.

6.3 AIM AND OBJECTIVE OF THE STUDY

1. To determine the effect of COVID-19 pandemic on hospitalisation trends and outcome in cardiovascular disorders.

7.0 MATERIALS AND METHODS

We will be conducting an Observational study hospital-based analysis of patients admitted under following cardiovascular diseases

- Ischemic Heart Disease (IHD)
- Pericardial disease
- Cardiomyopathy
- Valvular heart disease (Rheumatic, Congenital & Acquired)
- Arrhythmias
- Heart failure
- CVA
- Venous thromboembolism (DVT & PE)
- Peripheral arterial disease (PAD)
- Aortic Diseases (Dissection & Aneurysms)

Patients admitted with above illnesses from March 2020 to February 2022 will be our study group and those from March 2019 to February 2020 will be our control group. We will be comparing their baseline characteristics, presentations, past co-morbid illnesses, associated systemic findings, treatment strategy opted, complications and outcome.

7.1 SOURCE OF DATA

Data collection will be done by analyzing the records of admitted patient at HDHI unit of DMC & HOSPITAL.

7.2 METHOD OF COLLECTION OF DATA

INCLUSION CRITERIA: All patients admitted under following cardiovascular diseases from March 2019 to February 2021.

- Ischemic Heart Disease (IHD)
- Pericardial disease
- Cardiomyopathy
- Valvular heart disease (Rheumatic, Congenital & Acquired)
- Arrhythmias
- Heart failure
- CVA
- Venous thromboembolism (DVT & PE)

- Peripheral arterial disease (PAD)
- Aortic Diseases (Dissection & Aneurysms)

EXCLUSION CRITERIA:

1. Patients admitted with other than cardiovascular and respiratory illness.
2. Patients who went DAMA from emergency department.

OUTCOME: We plan to compare admission rates, presentation and in-hospital and all-cause mortality due to COVID-19 pandemic on cardiovascular diseases.

STATISTICAL ANALYSIS: After data has been collected, it will be subjected to analysis using appropriate statistical methods. The data obtained at various stages of the study will be compared taking into account the specific objectives of the study.

7.3 DOES THE STUDY REQUIRE ANY INVESTIGATIONS OR INTERVENTIONS TO BE CONDUCTED ON PATIENTS OR OTHER HUMANS OR ANIMALS? IF SO, PLEASE DESCRIBE BRIEFLY.

NO

7.4 HAS ETHICAL CLEARANCE BEEN OBTAINED FROM YOUR INSTITUTION IN CASE OF 7.3?

Yes, Attached herewith

- Coronary Angiography

Treatment Strategy

- OMT
- Thrombolysis
  - STK/TNK/Reteplase
  - Complications [CVA,GI bleed, Genitourinary bleed, Anaphylaxis]
  - Hemodynamic support [Inotropes/IABP/Mechanical Ventilation]
- Pharmacoinvasive
  - Radial/Femoral
  - Rescue/Elective
  - Complications [CVA,GI bleed, Genitourinary bleed, Anaphylaxis, Local site bleed]
  - Hemodynamic support [Inotropes/IABP/ Mechanical Ventilation]
- PCI
  - Radial/Femoral
  - Primary/Rescue/Elective
  - Complications [CVA,GI bleed, Genitourinary bleed, Anaphylaxis, Local site bleed]
  - Hemodynamic support [Inotropes/IABP/ Mechanical Ventilation]
- CABG
- Valvular Intervention
- Pericardiocentesis
- Device Therapy
  - TPI/PPI/ICD/CRT

Outcome Variables:

- Total Duration of Hospital Stay -
- In hospital Mortality -
    - All-cause mortality -
      [CVS/RS/GUT/CNS/NEURO/GASTRO/SCD/SYSTEMIC ILLNESS]
    - If Cardiac, whether related to
        - MI
        - HF
        - Mechanical complication
        - Stroke
        - SCD
    - If Covid positive
        - Hospital stay after positive report
        - Outcome

INFORMED PATIENT CONSENT

Date: _____

I.....D/o, W/o, S/o.....
.....am willing to participate in the study **"IMPACT OF COVID-19 PANDEMIC ON HOSPITALISATION TRENDS AND OUTCOME OF CARDIOVASCULAR DISORDERS; AN OBSERVATIONAL STUDY"** The procedure with its complications has been explained to me in local vernacular language. I have fully understood that no special tests and extra expenditure in any form, merely for the purpose of thesis is being carried out. I am free to opt out the study any time without assigning any reason.

मैं _____ पत्नी/पुत्र/पुत्री _____

निवासी _____

इस शोधकार्य **"IMPACT OF COVID-19 PANDEMIC ON HOSPITALISATION TRENDS AND OUTCOME OF CARDIOVASCULAR DISORDERS; AN OBSERVATIONAL STUDY"** में भाग लेने के लिए सहमत हूँ। मैं इस शोधकार्य में भाग लेने के लिए अपनी स्वेच्छा से तैयार हूँ। मैं पुष्टि करता/करती हूँ की यह स्वीकृति देने के लिए मुझे कोई आर्थिक प्रलोभन नहीं दिया गया और न ही दबाव डाला गया है। मुझे इस शोधकार्य का उद्देश्य स्पष्ट कर दिया गया है और मुझे यह विश्वास है की यह विज्ञान और मानवता के लाभ के लिए है। मुझे इस शोधकार्य में होने वाले जोखिम के बारे में समझा दिया गया है और मेरी समझ में यह जोखिम बहुत मामुली है।

मैं इस शोधकार्य में भाग लेने के सम्बन्ध में किसी भी समय अपनी अस्वीकृति व्यक्त कर सकता/सकती हूँ और मेरे अस्वीकृति व्यक्त करने का मेरे इलाज पर कोई प्रभाव नहीं पड़ेगा।

ਮੈ_____ਪਤਨੀ/ਪੁੱਤਰ/ਪੁੱਤਰੀ_____

ਵਾਸੀ _____

"IMPACT OF COVID-19 PANDEMIC ON HOSPITALISATION TRENDS AND OUTCOME OF CARDIOVASCULAR DISORDERS; AN OBSERVATIONAL STUDY" ਤੇ ਚਲ ਰਹੀ ਖੋਜ ਵਿਚ ਹਿੱਸਾ ਲੈਣ ਲਈ ਰਜ਼ਾਮੰਦ ਹਾਂ। ਇਸ ਖੋਜ ਕੰਮ ਵਿਚ ਹਿੱਸਾ ਲੈਣ ਲਈ ਮੈ ਆਪਣੀ ਮਰਜ਼ੀ ਨਾਲ ਤਿਆਰ ਹਾਂ। ਮੈ ਇਹ ਦਸਣਾ ਚਾਹੁੰਦਾ ਹਾਂ/ ਚਾਹੁੰਦੀ ਹਾਂ ਕੇ ਇਹ ਰਜ਼ਾਮੰਦੀ ਦੇਣ ਵਾਸਤੇ ਮੈਨੂ ਕਿਸੇ ਵੀ ਤਰਾਂ ਦਾ ਲੋਭ-ਲਾਲਚ ਨਹੀ ਦਿੱਤਾ ਗਿਆ ਅਤੇ ਨਾ ਹੀ ਕੋਈ ਦਬਾ ਪਾਇਆ ਗਿਆ ਹੈ। ਮੈਨੂ ਇਸ ਖੋਜ ਦਾ ਮਨੋਰਥ ਸਮਝਾ ਦਿੱਤਾ ਗਿਆ ਹੈ ਅਤੇ ਮੈਨੂ ਇਹ ਭਰੋਸਾ ਦਵਾਇਆ ਗਿਆ ਹੈ ਕੇ ਇਹ ਖੋਜ ਵਿਗਿਆਨ ਅਤੇ ਮਾਨਵਤਾ ਦੀ ਭਲਾਈ ਲਈ ਹੈ। ਮੈਨੂ ਇਸ ਖੋਜ ਵਿਚ ਹੋਣ ਵਾਲੇ ਖਤਰੇ ਬਾਰੇ ਸਮਝਾ ਦਿੱਤਾ ਗਿਆ ਹੈ ਅਤੇ ਮੈਨੂ ਇਹ ਯਕੀਨ ਹੈ ਕੇ ਇਹ ਖਤਰਾ ਬਹੁਤ ਮਾਮੂਲੀ ਹੈ। ਮੈਨੂ ਇਸ ਖੋਜ ਕੰਮ ਵਿਚ ਹਿੱਸਾ ਲੈਣ ਦਾ ਢੰਗ – ਤਰੀਕਾ ਸਮਝਾ ਦਿੱਤਾ ਗਿਆ ਹੈ।

ਮੈ ਇਸ ਖੋਜ ਕੰਮ ਵਿਚ ਹਿੱਸਾ ਲੈਣ ਬਾਰੇ ਆਪਣੀ ਰਜ਼ਾਮੰਦੀ ਕਿਸੇ ਵੀ ਸਮੇ ਵਾਪਸ ਲੈ ਸਕਦਾ ਹਾਂ/ ਸਕਦੀ ਹਾਂ ਅਤੇ ਮੇਰੀ ਰਜ਼ਾਮੰਦੀ ਵਾਪਸ ਲੈਣ ਦਾ ਮੇਰੇ ਇਲਾਜ ਤੇ ਕੋਈ ਅਸਰ ਨਹੀ ਹੋਵੇਗਾ।
